mXT640U 1.1

maXTouch 640-node Touchscreen Controller

maXTouch® Adaptive Sensing Touchscreen Technology

- Up to 32 X (transmit) lines and 20 Y (receive) lines
- A maximum of 640 nodes can be allocated to the touchscreen
- Touchscreen size 8.17 inches (16:10 aspect ratio), assuming a sensor electrode pitch of 5.5 mm. Other sizes may be possible with different electrode pitches and appropriate sensor material
- Multiple touch support with up to 16 concurrent touches tracked in real time
- Dual-boot OS support for Microsoft® Windows® and Android

Touch Sensor Technology

- Discrete/out-cell support including glass and PET film-based sensors
- On-cell/touch-on display support including TFT, IPS and OLED
- Synchronization with display refresh timing capability
- Support for standard (for example, Diamond) and proprietary sensor patterns (review of designs by Microchip recommended)

Front Panel Material

- Works with PET or glass, including curved profiles (configuration and stack-up to be approved by Microchip)
- Glass 0.4 mm to 4.5 mm, dependent on screen size, touch size and stack-up
- Plastic 0.2 mm to 2.2 mm, dependent on screen size, touch size and stack-up

Touch Performance

- Moisture/Water Compensation
  - No false touch with condensation or water drop up to 22 mm diameter
  - One-finger tracking with condensation or water drop up to 22 mm diameter
- Glove Support
  - Multiple-finger glove touches up to 1.5 mm thickness (subject to stack-up design)
  - Single-finger glove touch up to 5 mm thickness (subject to stack-up design)
- Mutual capacitance and self capacitance measurements supported for robust touch detection
- Noise suppression technology to combat ambient, charger noise, and power-line noise
  - Up to 240 Vpp between 1 Hz and 1 kHz sinusoidal waveform
  - Up to 20 Vpp between 1 kHz and 1 MHz sinusoidal waveform
- Stylus Support
  - Supports passive stylus with 1 mm contact diameter, subject to configuration, stack up, and sensor design
- Scan Speed
  - Up to 250 Hz one finger reporting rate, subject to configuration
  - Typical report rate for 10 touches ≥100 Hz (subject to configuration)
  - Initial touch latency <20 ms for first touch from idle, subject to configuration
  - Configurable to allow for power and speed optimization

On-chip Gestures

- Supports wake up/unlock gestures, including symbol recognition

Keys

- Up to 32 nodes can be allocated as mutual capacitance sensor keys (subject to other configurations)
- Support for 3 Generic Keys in addition to the touchscreen array (subject to other configurations)
- Adjacent Key Suppression (AKS) technology is supported for false key touch prevention

Enhanced Algorithms

- Lens bending algorithms to remove display noise
- Touch suppression algorithms to remove unintentional large touches, such as palm
- Palm Recovery Algorithm for quick restoration to normal state

Product Data Store Area

- Up to 32 bytes of user-defined data can be stored during production

Power Saving

- Programmable timeout for automatic transition from active to idle states
- Pipelined analog sensing detection and digital processing to optimize system power efficiency

Application Interfaces

- I^2C slave mode: Standard/Fast mode 400 kHz, Fast-mode Plus 1 MHz, High-speed mode up to 3.4 MHz
- HID-I^2C interface for Microsoft® Windows® 8.x and later versions
- Interrupt to indicate when a message is available
- SPI Debug Interface to read the real-time raw data for tuning and debugging purposes

Power Supply

- Digital (Vdd) 3.3 V nominal
- Digital I/O (VddIO) 3.3 V nominal
- Analog (AVdd) 3.3 V nominal
- High voltage internal X line drive (XVdd) 6.6 V with internal voltage pump
- High voltage internal X line drive (XVdd) 9.9 V with internal voltage pump

Packages

- 88-ball UFBGA 6 × 6 × 0.6 mm, 0.5 mm pitch
- 88-ball X1FBGA 6 × 6 × 0.45 mm, 0.5 mm pitch

Operating Temperature

- –40°C to +85°C

PIN CONFIGURATION

88-ball UFBGA/X1FBGA

TABLE OF CONTENTS

TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.

If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at **docerrors@microchip.com**. We welcome your feedback.

Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at:

http://www.microchip.com

You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (for example, DS30000000A is version A of document DS30000000).

Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.

To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; **http://www.microchip.com**
- Your local Microchip sales office (see last page)

When contacting Microchip, please specify which device, revision of silicon and data sheet (include literature number) you are using.

Customer Notification System

Register on our web site at **http://www.microchip.com** to receive the most current information on all of our products.

1.0 OVERVIEW OF MXT640U

The Microchip maXTouch family of touch controllers brings industry-leading capacitive touch performance to customer applications. The mXT640U features the latest generation of Microchip adaptive sensing technology that utilizes a hybrid mutual and self capacitive sensing system in order to deliver unparalleled touch features and a robust user experience.

- **Patented capacitive sensing method** – The mXT640U uses a unique charge-transfer acquisition engine to implement Microchip's patented capacitive sensing method. Coupled with a state-of-the-art CPU, the entire touchscreen sensing solution can measure, classify and track a number of individual finger touches with a high degree of accuracy in the shortest response time.
- **Capacitive Touch Engine (CTE)** – The mXT640U features an acquisition engine, which uses an optimal measurement approach to ensure almost complete immunity from parasitic capacitance on the receiver input lines. The engine includes sufficient dynamic range to cope with anticipated touchscreen self and mutual capacitances, which allows great flexibility for use with the Microchip proprietary sensor pattern designs. One- and two-layer ITO sensors are possible using glass or PET substrates.
- **Touch detection** – The mXT640U allows for both mutual and self capacitance measurements, with the self capacitance measurements being used to augment the mutual capacitance measurements to produce reliable touch information.

  When self capacitance measurements are enabled, touch classification is achieved using both mutual and self capacitance touch data. This has the advantage that both types of measurement systems can work together to detect touches under a wide variety of circumstances.

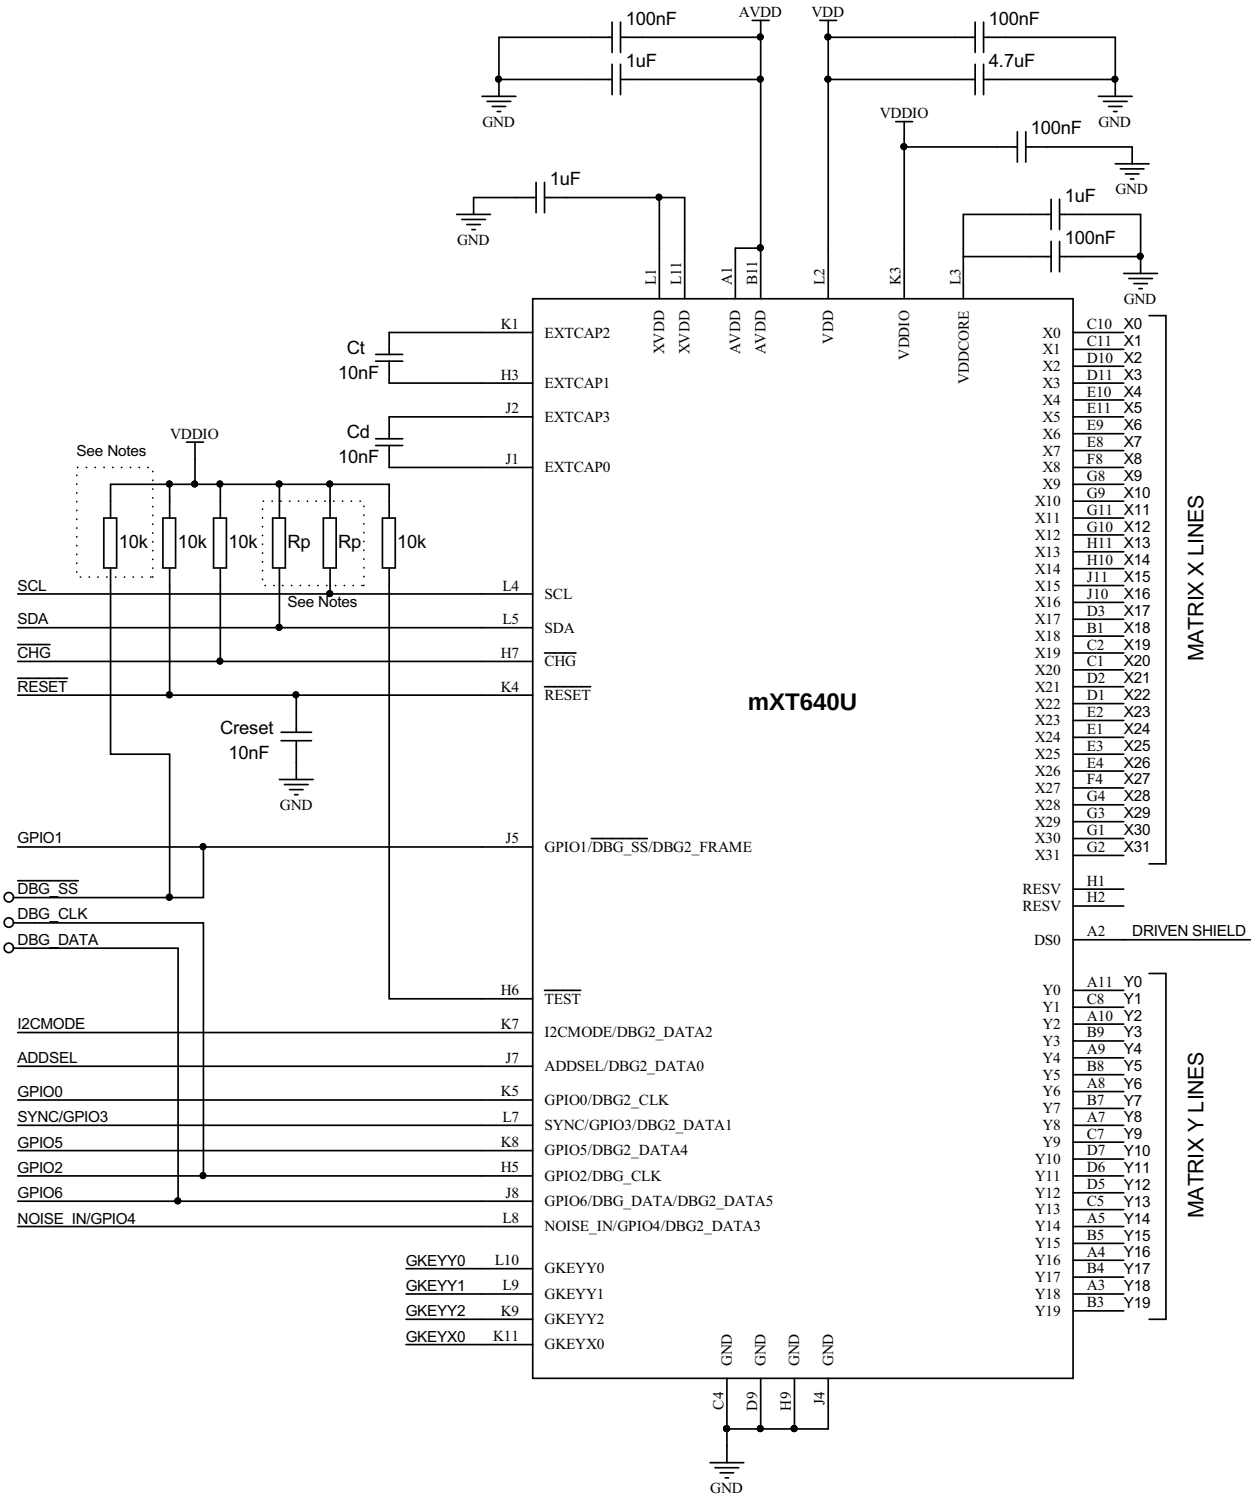
  The system may be configured for different types of default measurements in both idle and active modes. For example, the device may be configured for Mutual Capacitance Touch as the default in idle mode and Self Capacitance Touch as the default in active mode. Note that other types of scans (such as other types of self capacitance scans) may also be made depending on configuration.

  Mutual capacitance touch data is used wherever possible to classify touches as this has greater granularity than self capacitance measurements and provides positional information on touches. For this reason, multiple touches can only be determined by mutual capacitance touch data. In Self Capacitance Touch Default mode, if the self capacitance touch processing detects multiple touches, touchscreen processing is skipped until mutual capacitance touch data is available.

  Self capacitance measurements allow for the detection of single touches in extreme cases, such as single thick glove touches, when mutual capacitance touch detection alone may miss touches.
- **Display Noise Cancellation** – A combination of analog circuitry, hardware noise processing, and firmware that combats display noise without requiring additional listening channels or synchronization to display timing. This enables the use of shieldless touch sensor stacks, including touch-on-lens.
- **Noise filtering** – Hardware noise processing in the capacitive touch engine provides enhanced autonomous filtering and allows a broad range of noise profiles to be handled. The result is good performance in the presence of charger and LCD noise.
- **Processing power** – The main CPU has two powerful microsequencer coprocessors under its control consuming low power. This system allows the signal acquisition, preprocessing, postprocessing and housekeeping to be partitioned in an efficient and flexible way.
- **Interpreting user intention** – The Microchip hybrid mutual and self capacitance method provides unambiguous multitouch performance. Algorithms in the mXT640U provide optimized touchscreen position filtering for the smooth tracking of touches, responding to a user's intended touches while preventing false touches triggered by ambient noise, conductive material on the sensor surface, such as moisture, or unintentional touches from the user's resting palm or fingers.

2.0 SCHEMATICS

2.1 88-ball UFBGA/X1FBGA



See Section 2.2 “Schematic Notes”

2.2 Schematic Notes

2.2.1 POWER SUPPLY

The sense and I/O pins are supplied by the power rails on the device as listed in Table 0-1. This information is also indicated in "Pin configuration".

Table 0-1. Power Supply for Sense and I/O Pins

Power Supply	Pins
XVdd	X sense pins, GKEYX0
AVdd	Y sense pins, DS0
VddIO	$\overline{\text{RESET}}$, GPIO*n*, SDA, SCL, $\overline{\text{CHG}}$, ADDSEL, NOISE_IN, SYNC, GKEYY*n*, DBG_CLK, DBG_DATA, $\overline{\text{DBG\_SS}}$

2.2.2 DECOUPLING CAPACITORS

All decoupling capacitors must be X7R or X5R and placed less than 5 mm away from the balls for which they act as bypass capacitors. Pins of the same type can share a capacitor provided no pin is more than 10 mm from the capacitor.

The schematics on the previous pages show the optimum capacitors required. The parallel combination of capacitors is recommended to give high and low frequency filtering, which is beneficial if the voltage regulators are likely to be some distance from the device (for example, If an active tail design is used). Note that this requires that the voltage regulator supplies for AVdd, Vdd and VddIO are clean and noise free. It also assumes that the track length between the capacitors and on-board power supplies is less than 50 mm.

The number of base capacitors can be reduced if the pinout configuration means that sharing a bypass capacitor is possible (subject to the distance between the pins satisfying the conditions above and there being no routing difficulties).

2.2.3 PULL-UP RESISTORS

The pull-up resistors shown in the schematics are suggested typical values and may be modified to meet the requirements of an individual customer design. This applies, in particular, to the I^2C pull-up resistors (see Section 2.2.6 "I^2C Interface").

2.2.4 INTERNAL VOLTAGE PUMP

The voltage pump operates as either a voltage doubler or a voltage tripler.

To operate in voltage tripler mode, the voltage pump requires two external capacitors:

- EXTCAP0 must be connected to EXTCAP3 via a capacitor (Cd)
- EXTCAP1 must be connected to EXTCAP2 via a capacitor (Ct)

To operate in voltage doubler mode, the voltage pump requires one external capacitor:

- EXTCAP0 must be connected to EXTCAP3 via a capacitor (Cd)
- EXTCAP1 and EXTCAP2 should be left unconnected

Capacitors Cd and Ct should each provide a capacitance of 10 nF.

2.2.5 VDDCORE

VddCore is internally generated from the Vdd power supply. To guarantee stability of the internal voltage regulator, an external capacitor is required.

2.2.6 I^2C INTERFACE

The schematic shows pull-up resistors on the SDA and SCL lines. The values of these resistors depends on the speed of the I^2C interface. See Section 13.9 "I2C Specification" for details.

2.2.7 MULTIPLE FUNCTION PINS

Some pins may have multiple functions. In this case, only one function can be chosen and the circuit should be designed accordingly.

2.2.8 GPIO PINS

The mXT640U has 7 GPIO pins. The pins can be set to be either an input or an output, as required, using the GPIO Configuration T19 object.

Unused GPIO pins can be left externally unconnected as long as they are given a defined state by using the GPIO Configuration T19 object. By default GPIO pins are set to be inputs and if they are not used they should be connected to GND. Alternatively, they can be set as outputs using the GPIO Configuration T19 object and left open.

If the GPIO Configuration T19 object is not enabled for use, all the GPIO pins are unused.

Some GPIO pins have alternative functions. If an alternative function is used then this takes precedence over the GPIO function and the pin cannot be used as a GPIO pin. In particular:

- GPIO4 cannot be used if the NOISE_IN function is in use
- GPIO3 cannot be used if the SYNC function is in use
- The SPI Debug Interface functionality is shared with some of the GPIO pins. See Section 2.2.9 “SPI Debug Interface” for more details on the SPI Debug Interface and how to handle these pins if they are totally unused.

2.2.9 SPI DEBUG INTERFACE

The DBG_CLK, DBG_DATA and $\overline{\text{DBG\_SS}}$ Lines form the SPI Debug Interface. These pins should be routed to test points on all designs, such that they can be connected to external hardware during system development. See also Section 12.1 “SPI Debug Interface”.

The debug lines may share pins with other functionality. Only one function for each pin can be chosen and the circuit should be designed accordingly. Note that the pull-up resistor for $\overline{\text{DBG\_SS}}$ in the schematics is optional and should be present only if the line is used as $\overline{\text{DBG\_SS}}$.The DBG_CLK, DBG_DATA and $\overline{\text{DBG\_SS}}$ lines should not be connected to power or GND. For this reason, where these pins are shared with GPIO pins and they are totally unused (that is, they are not being used as debug or GPIO pins), they should be set as outputs.

3.0 TOUCHSCREEN BASICS

3.1 Sensor Construction

A touchscreen is usually constructed from a number of transparent electrodes. These are typically on a glass or plastic substrate. They can also be made using non-transparent electrodes, such as copper or carbon. Electrodes are constructed from Indium Tin Oxide (ITO) or metal mesh. Thicker electrodes yield lower levels of resistance (perhaps tens to hundreds of Ω/square) at the expense of reduced optical clarity. Lower levels of resistance are generally more compatible with capacitive sensing. Thinner electrodes lead to higher levels of resistance (perhaps hundreds to thousands of Ω/square) with some of the best optical characteristics.

Interconnecting tracks can cause problems. The excessive RC time constants formed between the resistance of the track and the capacitance of the electrode to ground can inhibit the capacitive sensing function. In such cases, the tracks should be replaced by screen printed conductive inks (non-transparent) outside the touchscreen viewing area.

3.2 Electrode Configuration

The specific electrode designs used in Microchip touchscreens are the subject of various patents and patent applications. Further information is available on request.

The device supports various configurations of electrodes as summarized in Section 4.0 “Sensor Layout”.

3.3 Scanning Sequence

All nodes are scanned in sequence by the device. There is a full parallelism in the scanning sequence to improve overall response time. The nodes are scanned by measuring capacitive changes at the intersections formed between the first X line and all the Y lines. Then the intersections between the next X line and all the Y lines are scanned, and so on, until all X and Y combinations have been measured.

The device can be configured in various ways. It is possible to disable some nodes so that they are not scanned at all. This can be used to improve overall scanning time.

3.4 Touchscreen Sensitivity

3.4.1 ADJUSTMENT

Sensitivity of touchscreens can vary across the extents of the electrode pattern due to natural differences in the parasitic capacitance of the interconnections, control chip, and so on. An important factor in the uniformity of sensitivity is the electrode design itself. It is a natural consequence of a touchscreen pattern that the edges form a discontinuity and hence tend to have a different sensitivity. The electrodes at the far edges do not have a neighboring electrode on one side and this affects the electric field distribution in that region.

A sensitivity adjustment is available for the whole touchscreen. This adjustment is a basic algorithmic threshold that defines when a node is considered to have enough signal change to qualify as being in detect.

3.4.2 MECHANICAL STACKUP

The mechanical stackup refers to the arrangement of material layers that exist above and below a touchscreen. The arrangement of the touchscreen in relation to other parts of the mechanical stackup has an effect on the overall sensitivity of the screen. QMatrix technology has an excellent ability to operate in the presence of ground planes close to the sensor. QMatrix sensitivity is attributed more to the interaction of the electric fields between the transmitting (X) and receiving (Y) electrodes than to the surface area of these electrodes. For this reason, stray capacitance on the X or Y electrodes does not strongly reduce sensitivity.

Front panel dielectric material has a direct bearing on sensitivity. Plastic front panels are usually suitable up to about 2.2 mm, and glass up to about 4.5 mm (dependent upon the screen size and layout). The thicker the front panel, the lower the signal-to-noise ratio of the measured capacitive changes and hence the lower the resolution of the touchscreen. In general, glass front panels are near optimal because they conduct electric fields almost twice as easily as plastic panels.

NOTE	Care should be taken using ultra-thin glass panels as retransmission effects can occur, which can significantly degrade performance.

4.0 SENSOR LAYOUT

The physical matrix can be configured to have one or more touch objects. These are configured using the appropriate touch objects (Multiple Touch Touchscreen and Key Array). It is not mandatory to have all the allowable touch objects present. The objects are disabled by default so only those that you wish to use need to be enabled.

4.1 Electrodes

The device supports various configurations of electrodes as summarized below:

- Touchscreen: 32 X × 20 Y (subject to other configurations)
- Standard Keys: Up to 32 keys in an X/Y grid (Key Array), implemented using standard sense lines
- Generic Keys: Up to 3 keys in an X/Y grid (Key Array), implemented using the Generic Key lines

Note that the 3 nodes provided by the Generic Key lines are in addition to the maximum 640 nodes permitted on the device. Note also that the Key Array must contain either Generic Key lines or standard sense lines, but not both.

NOTE	The specific electrode designs used in Microchip touchscreens are the subject of various patents and patent applications. Further information is available on request.

4.2 Touch Panel Layout

When designing the physical layout of the touch panel, the following rules must be obeyed:

- General layout rules:
  - Each touch object should be a regular rectangular shape in terms of the lines it uses.
- Additional layout rules for Multiple Touch Touchscreen T100:
  - Touchscreen object **must** start at X0, Y0.
  - A Multiple Touch Touchscreen T100 object cannot share an X or Y line with another touch object (for example, a Key Array T15).
  - Self Capacitance Touchscreens must have an even number of Y lines if low frequency compensation is used.
- Additional layout rules for Key Array T15:
  - A standard Key Array should occupy higher X and Y lines than those used by a Multiple Touch Touchscreen T100 object
  - A Key Array T15 object cannot share an X or Y line with a Multiple Touch Touchscreen T100 object.

4.3 Screen Size

Table 4-1 lists some typical screen size and electrode pitch combinations to achieve various aspect ratios.

TABLE 4-1: TYPICAL SCREEN SIZES

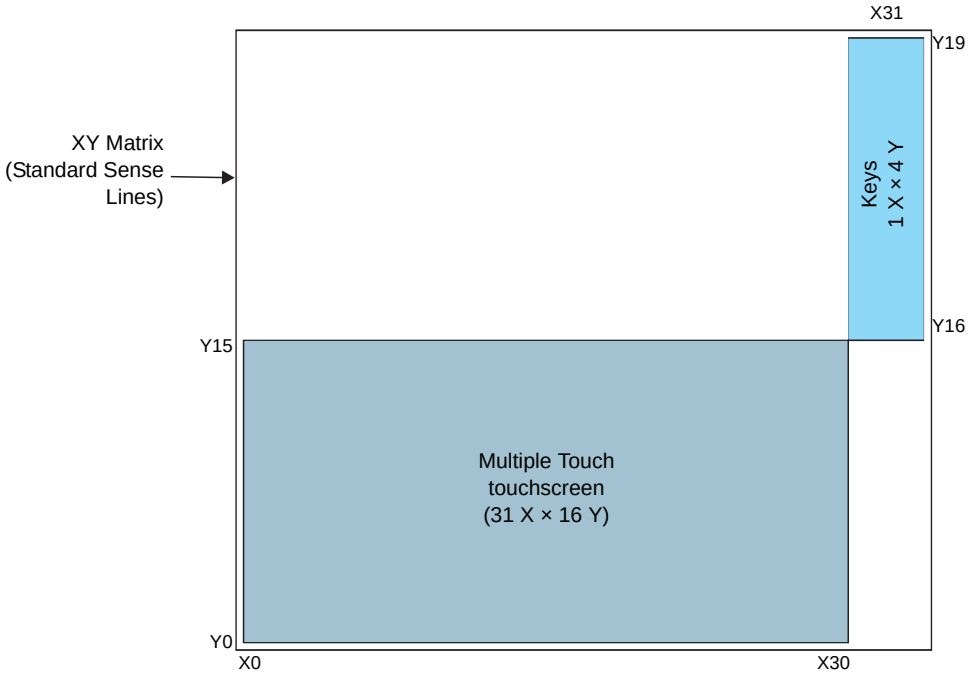
Aspect Ratio	Matrix Size	Node Count	Screen Diagonal (Inches)			
			4.5 mm Pitch	5 mm Pitch	5.5 mm Pitch	6 mm Pitch
16:10	X = 32, Y = 20	640	6.69	7.43	8.17	8.91
16:9	X = 32, Y = 18	576	6.5	7.23	7.95	8.67
8:3	X = 26, Y = 20	520	5.81	6.46	7.1	7.75

4.4 Standard Key Array

For optimal performance in terms of cycle time overhead, it is recommended that the number of X (drive) lines used for the standard Key Array is kept to the minimum and designs should favor using Y lines where possible.

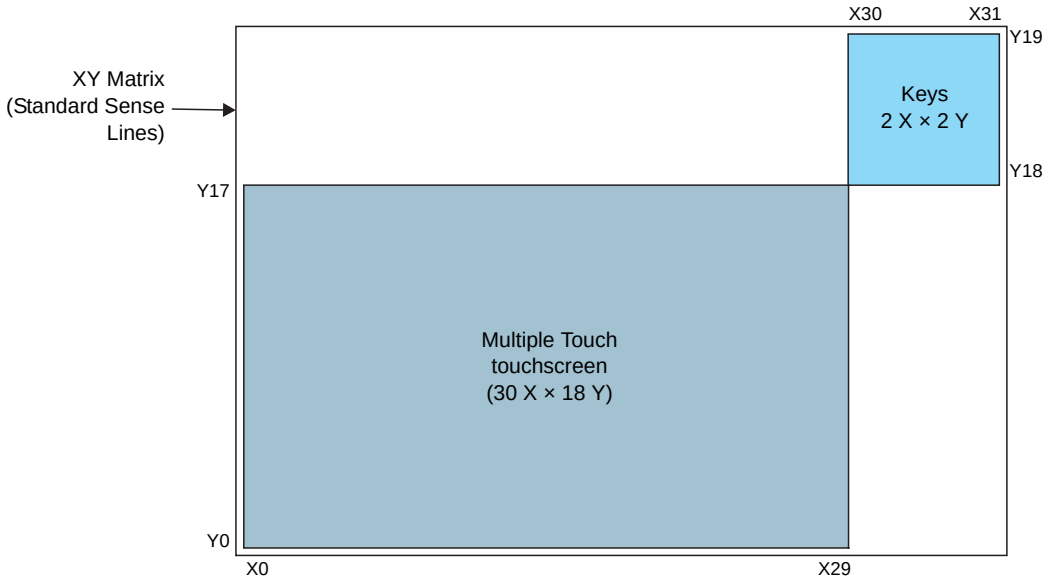
Figure 4-1 shows an example layout for a Touchscreen with a Key Array of 1 X × 4 Y lines. Note that in this case using 1 X × 4 Y lines for the Key Array would give better performance than using 4 X × 1 Y lines.

FIGURE 4-1: EXAMPLE LAYOUT – OPTIMAL CYCLE TIME



If, however, the intention is to preserve a larger touchscreen size and maintain an optimal aspect ratio, then using equal X and Y lines for the key array can be considered, as in Figure 4-2.

FIGURE 4-2: EXAMPLE LAYOUT – OPTIMAL ASPECT RATIO

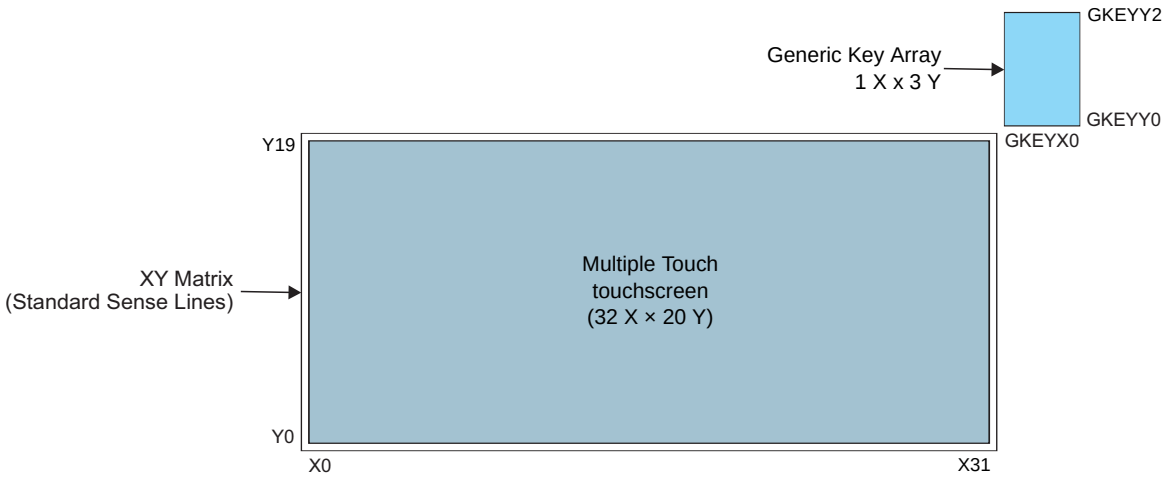


4.5 Generic Key Array

The Generic Key lines can be used to form 3 mutual capacitance nodes that can be used to form a Key Array only.

Using the Generic Keys may add extra noise line measurements, which will impact power consumption and timings. It is therefore recommended that, where spare mutual capacitance sense lines are available, the sense lines are used to form a standard Key Array in preference to using the Generic Key lines.

FIGURE 4-3: EXAMPLE LAYOUT – TOUCHSCREEN WITH GENERIC KEYS



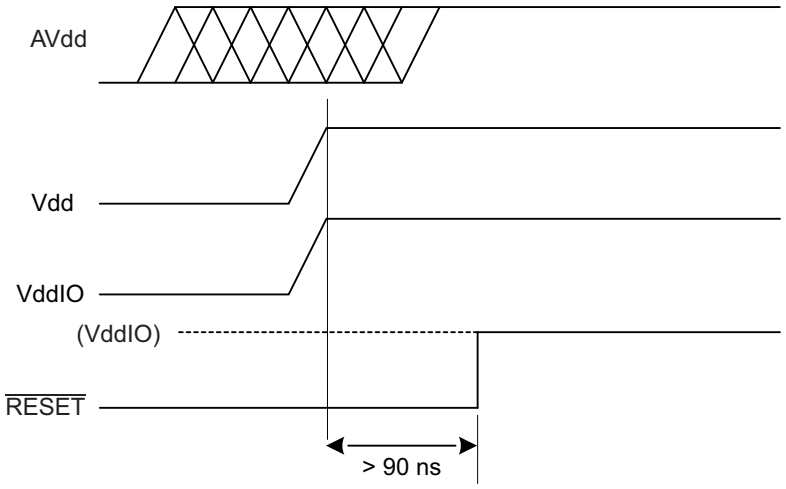
5.0 POWER-UP / RESET REQUIREMENTS

5.1 Power-on Reset

There is an internal Power-on Reset (POR) in the device.

If an external reset is to be used the device must be held in $\overline{\text{RESET}}$ (active low) while the digital (Vdd), analog (AVdd) and digital I/O (VddIO) power supplies are powering up. The supplies must have reached their nominal values before the $\overline{\text{RESET}}$ signal is deasserted (that is, goes high). This is shown in Figure 5-1. See Section 13.2 “Recommended Operating Conditions” for nominal values for the power supplies to the device.

FIGURE 5-1: POWER SEQUENCING ON THE MXT640U



Note: When using external $\overline{\text{RESET}}$ at power-up,
VddIO must not be enabled after Vdd

It is recommended that customer designs include the capability for the host to control all the maXTouch power supplies and pull the $\overline{\text{RESET}}$ line low.

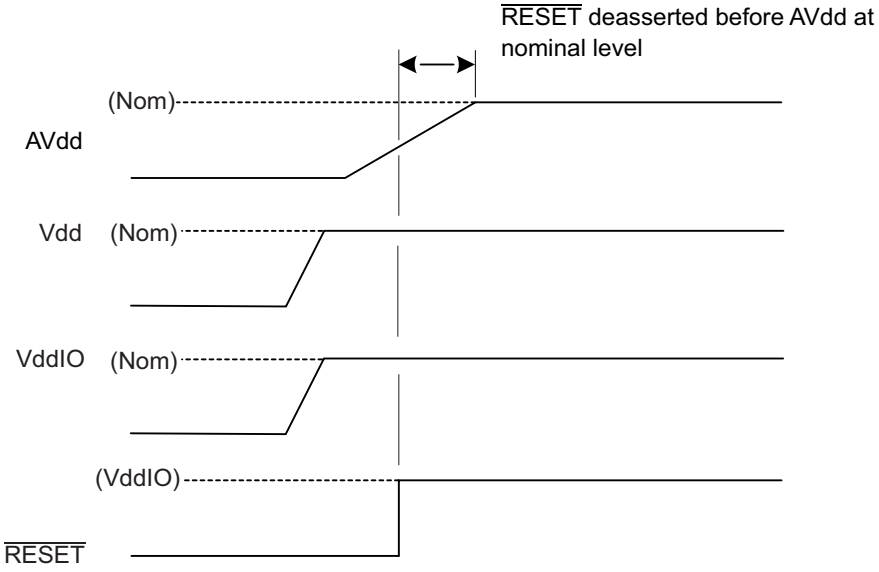
After power-up, the device typically takes 38 ms before it is ready to start communications.

NOTE	Device initialization will not complete until after all the power supplies are present. If any power supply is not present, internal initialization stalls and the device will not communicate with the host.

If the $\overline{\text{RESET}}$ line is released before the AVdd supply has reached its nominal voltage (see Figure 5-2), then some additional operations need to be carried out by the host. There are two options open to the host controller:

- Start the part in deep sleep mode and then send the command sequence to set the cycle time to wake the part and allow it to run normally. Note that in this case a calibration command is also needed.
- Send a RESET command.

FIGURE 5-2: POWER SEQUENCING ON THE MXT640U – LATE RISE ON AVDD



The RESET pin can be used to reset the device whenever necessary. The RESET pin must be asserted low for at least 90 ns to cause a reset. After releasing the RESET pin the device typically takes 38 ms before it is ready to start communications. It is recommended to connect the RESET pin to a host controller to allow it to initiate a full hardware reset without requiring a power-down.

WARNING	The device should be reset only by using the RESET line. If an attempt is made to reset by removing the power from the device without also sending the signal lines low, power will be drawn from the interface lines and the device will not reset correctly.

Make sure that any lines connected to the device are below or equal to Vdd during power-up. For example, if RESET is supplied from a different power domain to the VDDIO pin, make sure that it is held low when Vdd is off. If this is not done, the RESET signal could parasitically couple power via the RESET pin into the Vdd supply.

NOTE	The voltage level on the RESET pin of the device must never exceed VddIO (digital supply voltage).

A software RESET command (using the Command Processor T6 object) can be used to reset the chip. A software reset typically takes 57 ms. After the chip has finished it asserts the CHG line to signal to the host that a message is available. The reset flag is set in the Message Processor object to indicate to the host that it has just completed a reset cycle. This bit can be used by the host to detect any unexpected brownout events. This allows the host to take any necessary corrective actions, such as reconfiguration.

NOTE	The CHG line is briefly set as an input during power-up or reset. It is therefore particularly important that the line should be allowed to float high via the CHG line pull-up resistor during this period. It should not be driven by the host (see Section 13.6.3 “Reset Timings”).

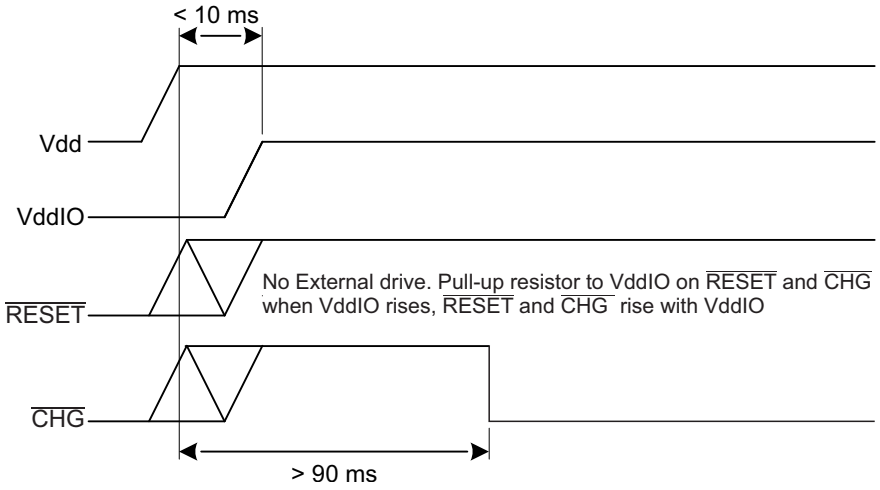
At power-on, the device performs a self-test routine (using the Self Test T25 object) to check for shorts that might cause damage to the device.

5.2 Power-up and Reset Sequence – VddIO Enabled after Vdd

The power-up sequence that can be used in applications where VddIO must be powered up after Vdd, is shown in Figure 5-3.

In this case the communication interface to the maXTouch device is not driven by the host system. The RESET and CHG pins are connected to VddIO using suitable pull-up resistors. Vdd is powered up, followed by VddIO, no more than 10 ms after Vdd. Due to the pull-up resistors, RESET and CHG will rise with VddIO. The internal POR system ensures reliable boot up of the device and the CHG line will go low approximately 38 ms after Vdd to notify the host that the device is ready to start communication.

FIGURE 5-3: POWER-UP SEQUENCE



6.0 DETAILED OPERATION

6.1 Touch Detection

The mXT640U allows for both mutual and self capacitance measurements, with the self capacitance measurements being used to augment the mutual capacitance measurements to produce reliable touch information.

When self capacitance measurements are enabled, touch classification is achieved using both mutual and self capacitance touch data. This has the advantage that both types of measurement systems can work together to detect touches under a wide variety of circumstances.

Mutual capacitance touch data is used wherever possible to classify touches as this has greater granularity than self capacitance measurements and provides positional information on touches.

Self capacitance measurements, on the other hand, allow for the detection of single touches in extreme cases, such as single thick glove touches, when touches can only be detected by self capacitance data and may be missed by mutual capacitance touch detection.

6.2 Operational Modes

The device operates in two modes: **Active** (touch detected) and **Idle** (no touches detected). Both modes operate as a series of burst cycles. Each cycle consists of a short burst (during which measurements are taken) followed by an inactive sleep period. The difference between these modes is the length of the cycles. Those in idle mode typically have longer sleep periods. The cycle length is configured using the IDLEACQINT and ACTVACQINT settings in the Power Configuration T7. In addition, an *Active to Idle Timeout* setting is provided.

6.3 Detection Integrator

The device features a touch detection integration mechanism. This acts to confirm a detection in a robust fashion. A counter is incremented each time a touch has exceeded its threshold and has remained above the threshold for the current acquisition. When this counter reaches a preset limit the sensor is finally declared to be touched. If, on any acquisition, the signal is not seen to exceed the threshold level, the counter is cleared and the process has to start from the beginning.

The detection integrator is configured using the appropriate touch objects (Multiple Touch Touchscreen T100, Key Array T15).

6.4 Sensor Acquisition

The charge time is set using the Acquisition Configuration T8 object.

A number of factors influence the acquisition time for a single drive line and the total acquisition time for the sensor as a whole must not exceed 250 ms. If this condition is not met, a SIGERR will be reported.

Care should be taken to configure all the objects that can affect the measurement timing, for example, Acquisition Configuration T8, CTE Configuration T46 and Self Capacitance Configuration T111, so that these limits are not exceeded.

6.5 Calibration

Calibration is the process by which a sensor chip assesses the background capacitance on each node. Nodes are only calibrated on reset and when:

- The node is enabled (that is, activated)

or

- The node is already enabled and one of the following applies:
  - The node is held in detect for longer than the Touch Automatic Calibration setting (TCHAUTOCAL in the Acquisition Configuration T8 object)
  - The signal delta on a node is at least the touch threshold (TCHTHR – TCHHYST) in the anti-touch direction, while it meets the criteria in the Touch Recovery Processes that results in a recalibration
  - The host issues a recalibrate command
  - Certain configuration settings are changed

A status message is generated on the start and completion of a calibration.

Note that the device performs a global calibration; that is, all the nodes are calibrated together.

6.6 Digital Filtering and Noise Suppression

The mXT640U supports on-chip filtering of the acquisition data received from the sensor. Specifically, the Noise Suppression T72 object provides an algorithm to suppress the effects of noise (for example, from a noisy charger plugged into the user's product). This algorithm can automatically adjust some of the acquisition parameters on-the-fly to filter the analog-to-digital conversions (ADCs) received from the sensor.

Additional noise suppression is provided by the Self Capacitance Noise Suppression T108 object. Similar in both design and configuration to the Noise Suppression T72 object, the Self Capacitance Noise Suppression T108 object is the noise suppression interface for self capacitance touch measurements.

Noise suppression is triggered when a noise source is detected.

- A hardware trigger can be implemented using the NOISE_IN pin.
- The host driver code can indicate when a noise source is present.
- The noise suppression is also triggered based on the noise levels detected using internal line measurements.The Noise Suppression T72 and Self Capacitance Noise Suppression T108 object selects the appropriate controls to suppress the noise present in the system.

6.7 Shieldless Support and Display Noise Suppression

The mXT640U can support shieldless sensor design even with a noisy LCD.

The Optimal Integration feature is not filtering as such, but enables the user to use a shorter integration window. The integration window optimizes the amount of charge collected against the amount of noise collected, to ensure an optimal SNR. This feature also benefits the system in the presence of an external noise source. This feature is configured using the Shieldless T56 object.

Display noise suppression allows the device to overcome display noise simultaneously with external noise. This feature is based on filtering provided by the Lens Bending T65 object (see Section 6.10 "Lens Bending").

6.8 Retransmission Compensation

The device can limit the undesirable effects on the mutual capacitance touch signals caused by poor device coupling to ground, such as poor sensitivity and touch break-up. This is achieved using the Retransmission Compensation T80 object. This object can be configured to allow the touchscreen to compensate for signal degradation due to these undesirable effects. If self capacitance measurements are also scheduled, the Retransmission Compensation T80 object will use the resultant data to enhance the compensation process.

The Retransmission Compensation T80 object is also capable of compensating for water presence on the sensor if self capacitance measurements are scheduled. In this case, both mutual capacitance and self capacitance measurements are used to detect moisture and then, once moisture is detected, self capacitance measurements are used to detect single touches in the presence of moisture.

6.9 Grip Suppression

The device has grip suppression functionality to suppress false detections from a user's grip.

Mutual capacitance grip suppression works by specifying a boundary around a touchscreen, within which touches can be suppressed whilst still allowing touches in the center of the touchscreen. This ensures that an accidental hand touch on the edge is suppressed while still allowing a "real" (finger) touch towards the center of the screen. Mutual capacitance grip suppression is configured using the Grip Suppression T40 object.

Self Capacitance grip suppression works by looking for characteristic shapes in the self capacitance measurement along the touchscreen boundary, and thereby distinguishing between a grip and a touch further into the sensor. Self capacitance grip suppression is configured using the Self Capacitance Grip Suppression T112 object.

6.10 Lens Bending

The device supports algorithms to eliminate disturbances from the measured signal.

When the sensor suffers from the screen deformation (lens bending) the signal values acquired by normal procedure are corrupted by the disturbance component (bend). The amount of bend depends on:

- The mechanical and electrical characteristics of the sensor
- The amount and location of the force applied by the user touch to the sensor

The Lens Bending T65 object measures the bend component and compensates for any distortion caused by the bend. As the bend component is primarily influenced by the user touch force, it can be used as a secondary source to identify the presence of a touch. The additional benefit of the Lens Bending T65 object is that it will eliminate LCD noise as well.

6.11 Glove Detection

The device has glove detection algorithms that process the measurement data received from the touchscreen classifying touches as potential gloved touches.

The Glove Detection T78 object is used to detect glove touches. In Normal Mode the Glove Detection T78 object applies vigorous glove classification to small signal touches to minimize the effect of unintentional hovering finger reporting. Once a gloved touch is found, the Glove Detection T78 object enters Glove Confidence Mode. In this mode the device expects the user to be wearing gloves so the classification process is much less stringent.

6.12 Stylus Support

The mXT640U allows for the particular characteristics of passive stylus touches, whilst still allowing conventional finger touches to be detected. The touch sensitivity and threshold controls for stylus touches are configured separately from those for conventional finger touches so that both types of touches can be accommodated.

Stylus support ensures that the small touch area of a stylus registers as a touch, as this would otherwise be considered too small for the touchscreen. Additionally, there are controls to distinguish a stylus touch from an unwanted approaching finger (such as on the hand holding the stylus).

Passive stylus touches are configured by the Passive Stylus T47 object. There is one instance of the Passive Stylus T47 object for each Multiple Touch Touchscreen T100 object present on the device.

6.13 Unintentional Touch Suppression

The Touch Suppression T42 object provides a mechanism to suppress false detections from unintentional touches from a large body area, such as from a face, ear or palm. The Touch Suppression T42 object also provides Maximum Touch Suppression to suppress all touches if more than a specified number of touches has been detected. There is one instance of the Touch Suppression T42 object for each Multiple Touch Touchscreen T100 object present on the device.

6.14 Adjacent Key Suppression Technology

Adjacent Key Suppression (AKS) technology is a patented method used to detect which touch object (Multiple Touch Touchscreen T100 or Key Array T15) is touched, and to suppress touches on the other touch objects, when touch objects are located close together.

The device has two levels of AKS:

- The first level works between the touch objects (Multiple Touch Touchscreen T100 and Key Array T15). The touch objects are assigned to AKS groups. If a touch occurs within one of the touch objects in a group, then touches within other objects inside that group are suppressed. For example, if a touchscreen and a Key Array are placed in the same AKS group, then a touch in the touchscreen will suppress touches in the Key Array, and vice versa. Objects can be in more than one AKS group.
- The second level of AKS is internal AKS within an individual Key Array object. If internal AKS is enabled, then when one key is touched, touches on all the other keys within the Key Array are suppressed. Note that internal AKS is not present on other types of touch objects.

7.0 HOST COMMUNICATIONS

Communication between the mXT640U and the host is achieved using one of the following interfaces:

- I²C (see Section 8.0 “I2C Communications”)
- HID-I²C (see Section 9.0 “HID-I²C Communications”)

Either host interface can be used, depending on the needs of the user’s project, but only one interface should be used in any one design.

7.1 I²C Mode Selection – I2CMODE Pin

The selection of the I²C or the HID-I²C mode is determined by connecting the I2CMODE pin according to Table 7-1.

TABLE 7-1: I²C MODE SELECTION

I2CMODE	Interface Selected
Connected to GND	HID-I²C
Pulled up to VddIO (1)	I²C
Floating	Mode is selected according to the I²C address (as determined by the ADDSEL pin). See Section 7.1.1 “Automatic Selection of I²C and HID-I²C Modes” for more information.

Note 1: Requires a pull-up resistor; see Section 2.0 “Schematics”

7.1.1 AUTOMATIC SELECTION OF I²C AND HID-I²C MODES

If the I2CMODE pin is left floating (that is, automatic mode selection), the device will listen on both I²C addresses and automatically select the protocol to be used depending on the first message received. In this case the ADDSEL pin determines the primary and secondary I²C addresses, and these in turn determine the communications mode to be used. If the primary I²C address is detected, I²C is used for communications; if the I²C secondary address is detected, HID-I²C is used.

The selection of both the communications mode and the I²C addresses is summarized in Table 7-2.

TABLE 7-2: COMMUNICATIONS MODE SELECTION

I2CMODE	ADDSEL	Mode
0 (HID-I²C selected)	0 (Address = 0x4A)	HID-I²C communications at 0x4A
	1 (Address = 0x4B)	HID-I²C communications at 0x4B
1 (I²C selected)	0 (Address = 0x4A)	I²C communications at 0x4A
	1 (Address = 0x4B)	I²C communications at 0x4B
No input or input floating (auto selection)	0 (Primary address = 0x4A, secondary address = 0x4B)	I²C communications at 0x4A (primary address) HID-I²C communications at 0x4B (secondary address)
	1 (Primary address = 0x4B, secondary address = 0x4A)	I²C communications at 0x4B (primary address) HID-I²C communications at 0x4A (secondary address)

7.2 I²C Address Selection – ADDSEL Pin

If the I2CMODE pin is not floating (that is, a particular mode is chosen), the I²C address is selected by connecting the ADDSEL pin according to Table 7-3.

TABLE 7-3: I²C ADDRESS SELECTION

ADDSEL	I²C Address
Connected to GND	0x4A
Pulled up to VddIO (1)	0x4B

Note 1: Requires a pull-up resistor; see Section 2.0 “Schematics”

8.0 I²C COMMUNICATIONS

The device can use an I²C interface for communication.

The I²C interface is used in conjunction with the $\overline{CHG}$ line. The $\overline{CHG}$ line going active signifies that a new data packet is available. This provides an interrupt-style interface and allows the device to present data packets when internal changes have occurred.

See Section 7.0 “Host Communications” for information on selecting I²C mode.

8.1 I²C Addresses

The device supports two I²C device addresses that are selected using the ADDSEL line at start up. The two internal I²C device addresses are 0x4A and 0x4B. The selection of the address (and the communication mode) is described in Section 7.2 “I²C Address Selection – ADDSEL Pin”.

The I²C address is shifted left to form the SLA+W or SLA+R address when transmitted over the I²C interface, as shown in Table 8-1.

TABLE 8-1: FORMAT OF AN I²C ADDRESS

Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Address: 0x4A or 0x4B							Read/write

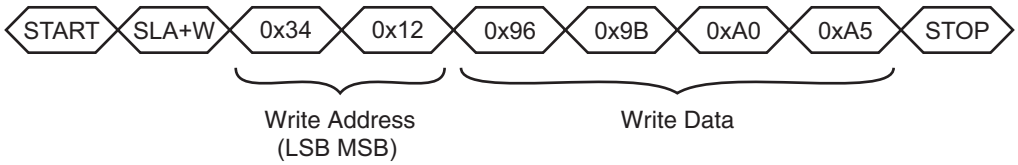
8.2 Writing To the Device

A WRITE cycle to the device consists of a START condition followed by the I²C address of the device (SLA+W). The next two bytes are the address of the location into which the writing starts. The first byte is the Least Significant Byte (LSByte) of the address, and the second byte is the Most Significant Byte (MSByte). This address is then stored as the address pointer.

Subsequent bytes in a multi-byte transfer form the actual data. These are written to the location of the address pointer, location of the address pointer + 1, location of the address pointer + 2, and so on. The address pointer returns to its starting value when the WRITE cycle STOP condition is detected.

Figure 8-1 shows an example of writing four bytes of data to contiguous addresses starting at 0x1234.

FIGURE 8-1: EXAMPLE OF A FOUR-BYTE WRITE STARTING AT ADDRESS 0X1234

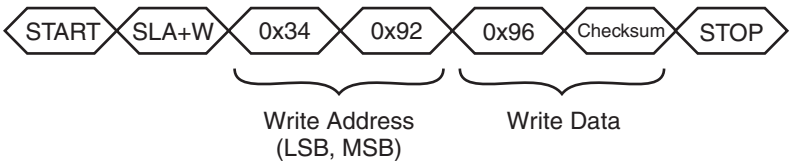


8.3 I²C Writes in Checksum Mode

In I²C checksum mode an 8-bit CRC is added to all I²C writes. The CRC is sent at the end of the data write as the last byte before the STOP condition. All the bytes sent are included in the CRC, including the two address bytes. Any command or data sent to the device is processed even if the CRC fails.

To indicate that a checksum is to be sent in the write, the most significant bit of the MSByte of the address is set to 1. For example, the I²C command shown in Figure 8-2 writes a value of 150 (0x96) to address 0x1234 with a checksum. The address is changed to 0x**9**234 to indicate checksum mode.

FIGURE 8-2: EXAMPLE OF A WRITE TO ADDRESS 0X1234 WITH A CHECKSUM



8.4 Reading From the Device

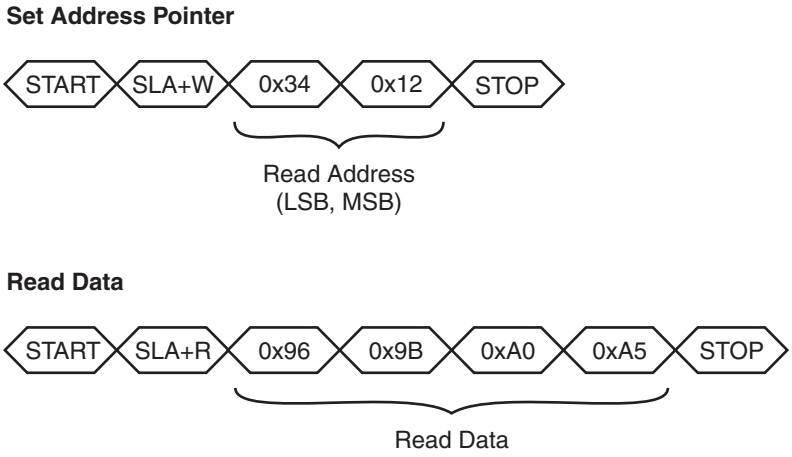
Two I^2C bus activities must take place to read from the device. The first activity is an I^2C write to set the address pointer (LSByte then MSByte). The second activity is the actual I^2C read to receive the data. The address pointer returns to its starting value when the read cycle NACK is detected.

It is not necessary to set the address pointer before every read. The address pointer is updated automatically after every read operation. The address pointer will be correct if the reads occur in order. In particular, when reading multiple messages from the Message Processor T5 object, the address pointer is automatically reset to allow continuous reads (see Section 8.5 “Reading Status Messages with DMA”).

The WRITE and READ cycles consist of a START condition followed by the I^2C address of the device (SLA+W or SLA+R respectively). Note that in this mode, calculating a checksum of the data packets is not supported.

Figure 8-3 shows the I^2C commands to read four bytes starting at address 0x1234.

FIGURE 8-3: EXAMPLE OF A FOUR-BYTE READ STARTING AT ADDRESS 0X1234



8.5 Reading Status Messages with DMA

The device facilitates the easy reading of multiple messages using a single continuous read operation. This allows the host hardware to use a direct memory access (DMA) controller for the fast reading of messages, as follows:

1. The host uses a write operation to set the address pointer to the start of the Message Count T44 object, if necessary. Note that the STOP condition at the end of the read resets the address pointer to its initial location, so it may already be pointing at the Message Count T44 object following a previous message read. If a checksum is required on each message, the most significant bit of the MSByte of the read address must be set to 1.
2. The host starts the read operation of the message by sending a START condition.
3. The host reads the Message Count T44 object (one byte) to retrieve a count of the pending messages.
4. The host calculates the number of bytes to read by multiplying the message count by the size of the Message Processor T5 object. Note that the host should have already read the size of the Message Processor T5 object in its initialization code.
5. Note that the size of the Message Processor T5 object as recorded in the Object Table includes a checksum byte. If a checksum has not been requested, one byte should be deducted from the size of the object. That is: number of bytes = count × (size – 1).
6. The host reads the calculated number of message bytes. It is important that the host does *not* send a STOP condition during the message reads, as this will terminate the continuous read operation and reset the address pointer. No START and STOP conditions must be sent between the messages.
7. The host sends a STOP condition at the end of the read operation after the last message has been read. The NACK condition immediately before the STOP condition resets the address pointer to the start of the Message Count T44 object.

Figure 8-4 shows an example of using a continuous read operation to read three messages from the device without a checksum. Figure 8-5 shows the same example with a checksum.

FIGURE 8-4: CONTINUOUS MESSAGE READ EXAMPLE – NO CHECKSUM

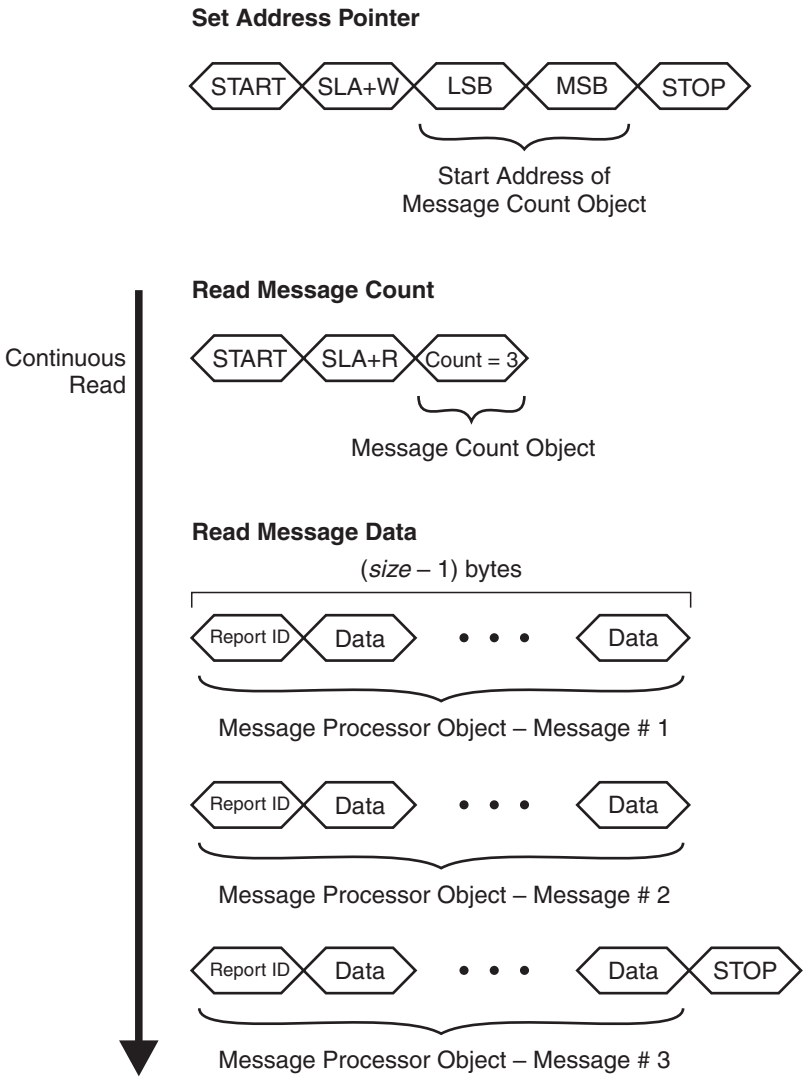


FIGURE 8-5: CONTINUOUS MESSAGE READ EXAMPLE – I²C CHECKSUM MODE

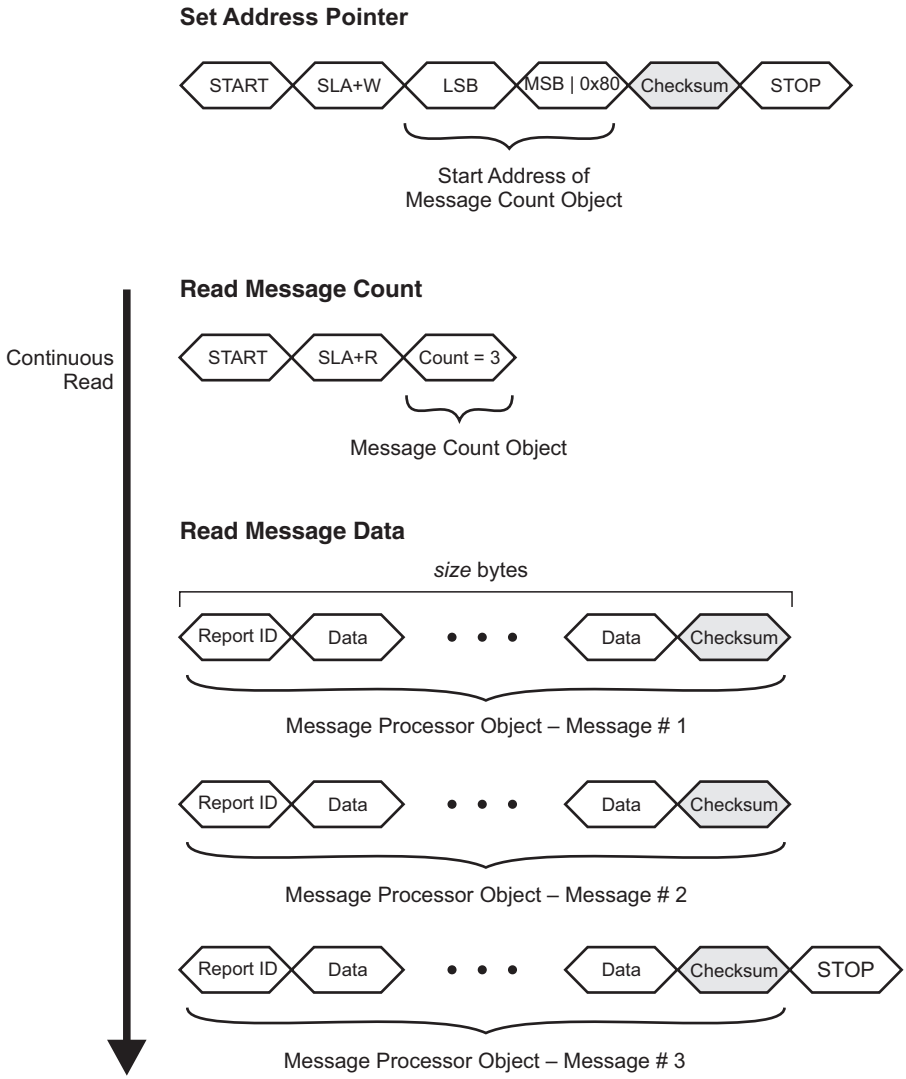


There are no checksums added on any other I²C reads. An 8-bit CRC can be added, however, to all I²C writes, as described in Section 8.3 “I²C Writes in Checksum Mode”.

An alternative method of reading messages using the $\overline{\text{CHG}}$ line is given in Section 8.6 “CHG Line”.

8.6 $\overline{\text{CHG}}$ Line

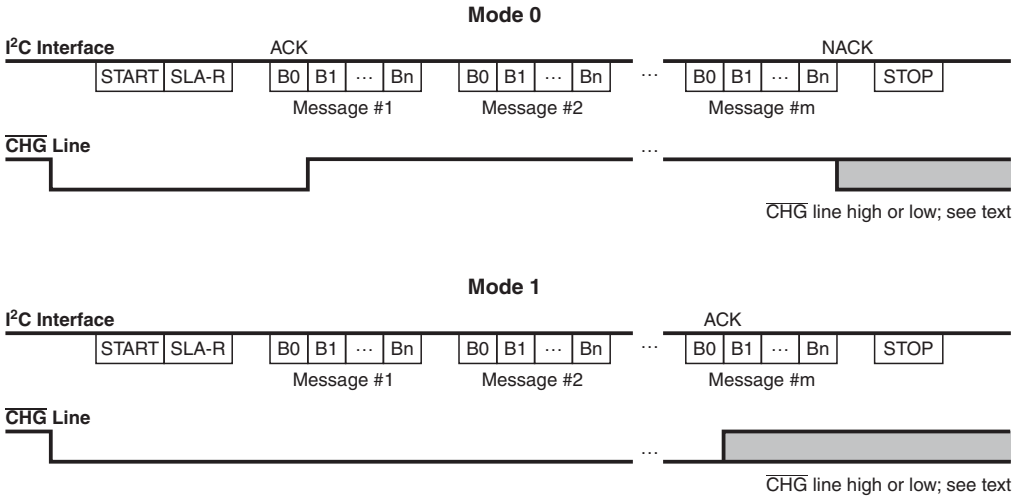
The $\overline{\text{CHG}}$ line is an active-low, open-drain output that is used to alert the host that a new message is available in the Message Processor T5 object. This provides the host with an interrupt-style interface with the potential for fast response times. It reduces the need for wasteful I²C communications.

The $\overline{\text{CHG}}$ line should always be configured as an input on the host during normal usage. This is particularly important after power-up or reset (see Section 5.0 “Power-up / Reset Requirements”).

A pull-up resistor is required to VddIO (see Section 2.0 “Schematics”).

The $\overline{\text{CHG}}$ line operates in two modes when it is used with I²C communications, as defined by the Communications Configuration T18 object.

FIGURE 8-6: $\overline{\text{CHG}}$ LINE MODES FOR I²C-COMPATIBLE TRANSFERS



In Mode 0 (edge-triggered operation):

1. The $\overline{\text{CHG}}$ line goes low to indicate that a message is present.
2. The $\overline{\text{CHG}}$ line goes high when the first byte of the first message (that is, its report ID) has been sent and acknowledged (ACK sent) and the next byte has been prepared in the buffer.
3. The STOP condition at the end of an I²C transfer causes the $\overline{\text{CHG}}$ line to stay high if there are no more messages. Otherwise the $\overline{\text{CHG}}$ line goes low to indicate a further message.

Note that Mode 0 also allows the host to continually read messages by simply continuing to read bytes back without issuing a STOP condition. Message reading should end when a report ID of 255 (“invalid message”) is received. Alternatively the host ends the transfer by sending a NACK after receiving the last byte of a message, followed by a STOP condition. If there is another message present, the $\overline{\text{CHG}}$ line goes low again, as in step 1. In this mode the state of the $\overline{\text{CHG}}$ line does not need to be checked during the I²C read.

In Mode 1 (level-triggered operation):

1. The $\overline{\text{CHG}}$ line goes low to indicate that a message is present.
2. The $\overline{\text{CHG}}$ line remains low while there are further messages to be sent after the current message.
3. The $\overline{\text{CHG}}$ line goes high again only once the first byte of the last message (that is, its report ID) has been sent and acknowledged (ACK sent) and the next byte has been prepared in the output buffer.

Mode 1 allows the host to continually read the messages until the $\overline{\text{CHG}}$ line goes high, and the state of the $\overline{\text{CHG}}$ line determines whether or not the host should continue receiving messages from the device.

NOTE	The state of the $\overline{\text{CHG}}$ line should be checked only between messages and not between the bytes of a message. The precise point at which the $\overline{\text{CHG}}$ line changes state cannot be predicted and so the state of the $\overline{\text{CHG}}$ line cannot be guaranteed between bytes.

The Communications Configuration T18 object can be used to configure the behavior of the $\overline{\text{CHG}}$ line. In addition to the $\overline{\text{CHG}}$ line operation modes described above, this object allows direct control over the state of the $\overline{\text{CHG}}$ line.

8.7 SDA and SCL

The I²C bus transmits data and clock with SDA and SCL, respectively. These are open-drain. The device can only drive these lines low or leave them open. The termination resistors (Rp) pull the line up to VddIO if no I²C device is pulling it down.

The termination resistors should be chosen so that the rise times on SDA and SCL meet the I²C specifications for the interface speed being used, bearing in mind other loads on the bus. For best latency performance, it is recommended that no other devices share the I²C bus with the maXTouch controller.

8.8 Clock Stretching

The device supports clock stretching in accordance with the I^2C specification. It may also instigate a clock stretch if a communications event happens during a period when the device is busy internally. The maximum clock stretch is approximately 10 – 15 ms.

9.0 HID-I²C COMMUNICATIONS

The device is an HID-I²C device presenting two Top-level Collections (TLCs):

- **Generic HID-I²C** – Provides a generic HID-I²C interface that allows the host to communicate with the device using the object-based protocol (OBP).
- **Digitizer HID-I²C** – Supplies touch information to the host. This interface is supported by Microsoft Windows without the need for additional software.

See Section 7.0 “Host Communications” for information on selecting HID-I²C mode.

Other features are identical to standard I²C communication described in Section 8.0 “I2C Communications”.

Refer to the Microsoft HID-I²C documentation, *HID Over I²C Protocol Specification – Device Side*, for information on the HID-I²C specification.

9.1 I²C Addresses

See Section 8.1 “I2C Addresses”.

9.2 Device Specification

The device is compliant with HID-I²C specification V1.0. It has the specification shown in Table 9-1.

TABLE 9-1: DEVICE SPECIFICATION

Parameter	Value
Vendor ID	0x03EB (Microchip)
Product ID	0x2163 (mXT640U)
Version ID	16-bit Version & Build Identifier in the form 0xVVBB, where: VV = Version Major (Upper 4 bits) / Minor (Lower 4 bits) BB = Build number in BCD format
HID Descriptor Address	0x0000

9.3 HID Descriptor

The host should read the HID descriptor on initialization to ascertain the key attribute of the HID device. These include the report description and the report ID to be used for communication with the HID device. The HID descriptor address is 0x0000.

Note that the host driver must not make any assumptions about the report packet formats, data locations or report IDs. These must be read from the HID descriptor as they may change in future versions of the firmware.

For more information on how to read the HID descriptor, refer to the Microsoft HID-I²C documentation.

9.4 HID-I²C Report IDs

Table 9-2 describes the HID-I²C report IDs used in reports sent to the host.

NOTE The term HID-I²C report ID should not be confused with the term report Id as used in the Object Protocol; the two are entirely different concepts. Refer to the *mXT640U 1.1 Protocol Guide* for more information on the use of Object Protocol report IDs.

TABLE 9-2: HID-I²C REPORT IDS

Report ID	Description	Top-level Collection
0x06	Object Protocol (OBP) command and response (see Section 9.5 “Generic HID-I²C TLC”)	Generic HID-I²C

TABLE 9-2: HID-I²C REPORT IDS (CONTINUED)

Report ID	Description	Top-level Collection
0x01	Touch report (see Section 9.6.1 “Touch Report”)	Digitizer HID-I²C
0x02	Maximum Touches (Surface Contacts) report (see Section 9.6.3 “Maximum Touches Report”)	Digitizer HID-I²C
0x05	Touch Hardware Quality Assurance (THQA) report (see Section 9.6.4 “Touch Hardware Quality Assurance (THQA) Report”)	Digitizer HID-I²C

9.5 Generic HID-I²C TLC

The Generic HID-I²C TLC supports an input report for receiving data from the device and an output report for sending data to the device.

Commands are sent by the host using the output reports. Responses from the device are sent using input reports.

Supported commands are:

- Read/Write Memory Map
- Send Auto-return Messages

The HID-I²C report ID used is that for Object Protocol commands and responses; see Table 9-2 for the value.

9.5.1 READ/WRITE MEMORY MAP COMMAND

This command is used to carry out a write/read operation on the memory map of the device.

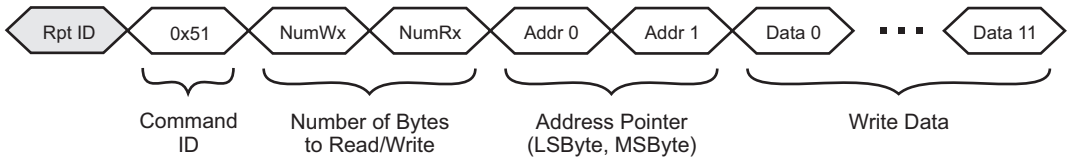
The data packet for a read/write command consists of 18 bytes, made up of a 1-byte HID-I²C report ID followed by 17 bytes of data (see Figure 9-1).

FIGURE 9-1: READ/WRITE MEMORY MAP – GENERIC PACKET FORMAT

9.5.1.1 Command and Response Packets

The command packet has the generic format given in Figure 9-2. The following sections give examples on using the command to write to the memory map and to read from the memory map.

FIGURE 9-2: READ/WRITE MEMORY MAP – COMMAND PACKET FORMAT



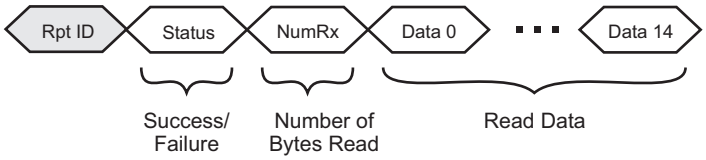
In Figure 9-2:

- **Rpt ID** is the HID-I²C report ID used for Object Protocol commands and responses (see Table 9-2).
- **Command ID** is the command ID for the write/read operation (0x51)
- **NumWx** is the number of data bytes to write to the memory map (may be zero). If the address pointer is being sent, this must include the size of the address pointer.
- **NumRx** is the number of data bytes to read from the memory map (may be zero).
- **Addr 0** and **Addr 1** form the address pointer to the memory map (where necessary; may be zero if not needed). This is typically an address of an object within the device.

- **Data 0** to **Data 11** are the bytes of data to be written (in the case of a write). Note that data locations beyond the number specified by NumWx will be ignored.

The response packet has the generic format given in Figure 9-3.

FIGURE 9-3: READ/WRITE MEMORY MAP – RESPONSE PACKET FORMAT



In Figure 9-3:

- **Rpt ID** is the HID-I^{2}C report ID used for Object Protocol commands and responses (see Table 9-2).
- **Status** indicates the result of the command:
  - 0x00 = read and write completed; read data returned
  - 0x04 = write completed; no read data requested
- **NumRx** is the number of bytes following that have been read from the memory map (in the case of a read). This will be the same value as NumRx in the command packet.
- **Data 0** to **Data 14** are the data bytes read from the memory map.

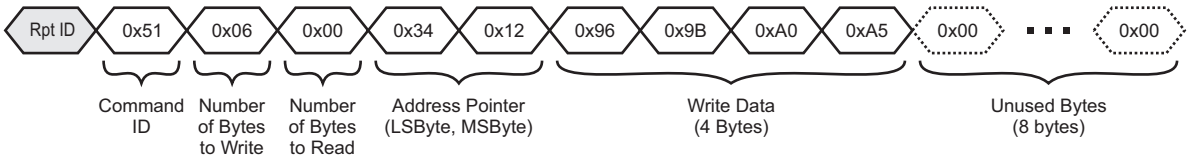
9.5.1.2 Writing To the Device

A write operation cycle to the device consists of sending a packet that contains six header bytes. These specify the HID-I^{2}C report ID, the Command ID, the number of bytes to read, the number of bytes to write, and the 16-bit address pointer.

Subsequent bytes in a multi-byte transfer form the actual data. These are written to the location of the address pointer, location of the address pointer +1, location of the address pointer + 2, and so on.

Figure 9-4 shows an example command packet to write four bytes of data to contiguous addresses starting at 0x1234.

FIGURE 9-4: EXAMPLE OF A FOUR-BYTE WRITE COMMAND STARTING AT ADDRESS 0X1234

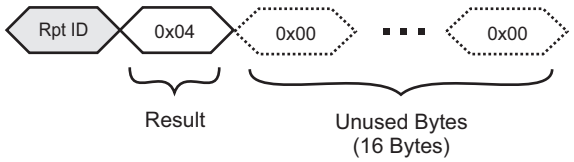


In Figure 9-4:

- **Rpt ID** is the HID-I^{2}C report ID used for Object Protocol commands and responses (see Table 9-2).
- **Number of Bytes to Read** is set to zero as this is a write-only operation.
- **Number of Bytes to Write** is six (that is, four data bytes plus the two address pointer bytes).

Figure 9-5 shows the response to this command. In this case, the result status returned is 0x04 (that is, the write operation was completed but no read data was requested). Note that the report ID will be the same one used in the command packet.

FIGURE 9-5: RESPONSE TO EXAMPLE FOUR-BYTE WRITE

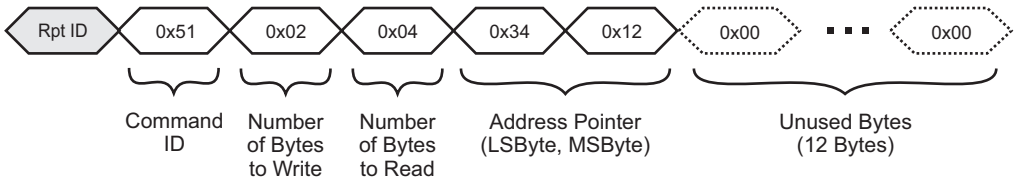


9.5.1.3 Reading From the Device

A read operation consists of sending a packet that contains the six header bytes only and no write data.

Figure 9-6 shows an example command packet to read four bytes starting at address 0x1234. Note that the address pointer is included in the number of bytes to write, so the number of bytes to write is set to 2 as there are no other data bytes to be written.

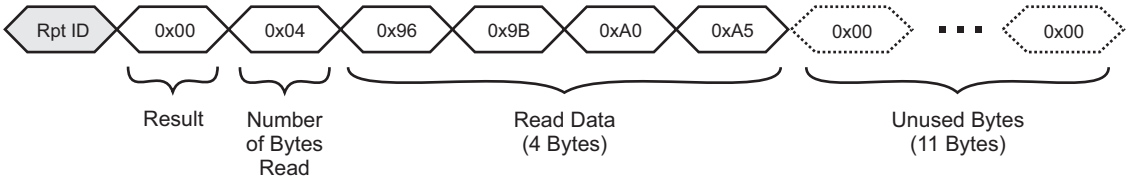
FIGURE 9-6: EXAMPLE OF A FOUR-BYTE READ COMMAND STARTING AT ADDRESS 0X1234



It is not necessary to set the address pointer before every read. The address pointer is updated automatically after every read operation, so the address pointer will be correct if the reads occur in order.

Figure 9-7 shows the response to this command. The result status returned is 0x00 (that is the write operation was completed and the data was returned). The number of bytes returned will be the same as the number requested (4 in this case).

FIGURE 9-7: RESPONSE TO EXAMPLE FOUR-BYTE READ

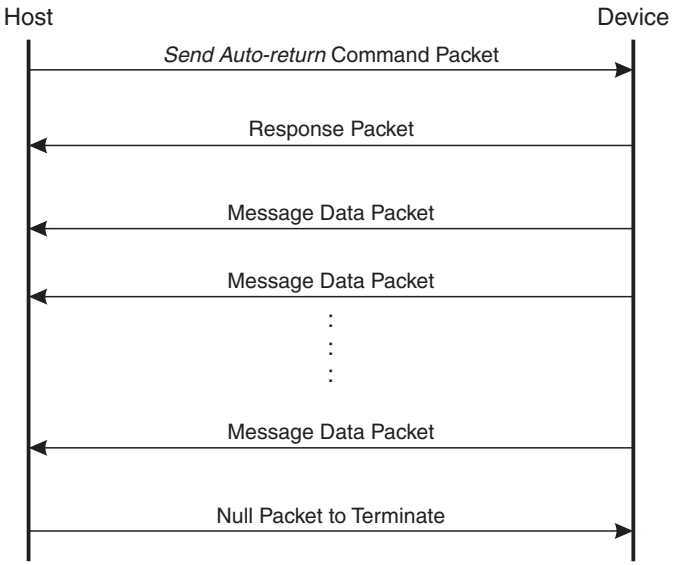


9.5.2 SEND AUTO-RETURN COMMAND

With this command the device can be configured to return new messages from the Message Processor T5 object autonomously.

The packet sequence to do this is shown in Figure 9-8.

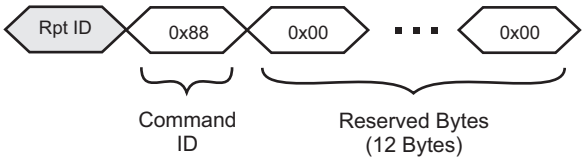
FIGURE 9-8: SEND AUTO-RETURN – PACKET SEQUENCE



The data packet for Send Auto-return commands consists of 14 bytes, made up of a 1-byte HID-I^{2}C report ID followed by 13 bytes of data. Note that this is different to the packet for standard read/write operations described in Section 9.5.1 "Read/Write Memory Map Command".

The command packet has the format given in Figure 9-9.

FIGURE 9-9: SEND AUTO-RETURN – COMMAND PACKET FORMAT



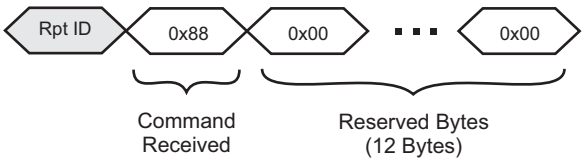
In Figure 9-9:

- **Rpt ID** is the HID-I^{2}C report ID used for Object Protocol commands and responses (see Table 9-2).
- **Command ID** is the command ID for the Send Auto-return command (0x88)
- **Reserved Bytes** are reserved bytes with a value of 0x00.

Note that with this command, the command packet does not include an address pointer as the device already knows the address of the Message Processor T5 object.

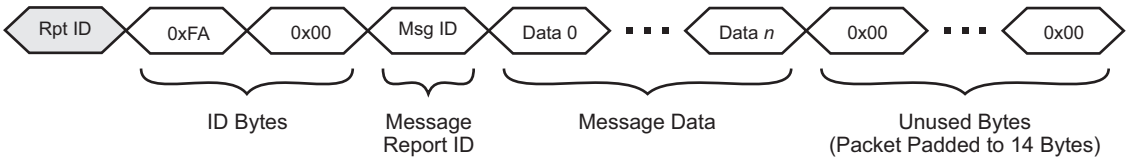
The response packet has the format given in Figure 9-10.

FIGURE 9-10: SEND AUTO-RETURN – RESPONSE PACKET FORMAT



Once the device has responded to the command, it starts sending message data. Each time a message is generated in the Message Processor T5 object, the device automatically sends a message packet to the host with the data. The message packets have the format given in Figure 9-11.

FIGURE 9-11: SEND AUTO-RETURN – MESSAGE PACKET FORMAT

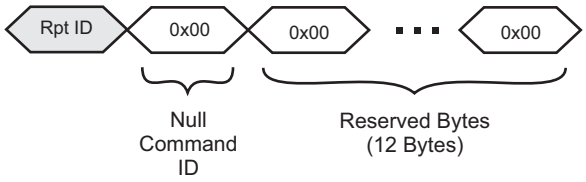


In Figure 9-11:

- **Rpt ID** is the HID-I^{2}C report ID used for Object Protocol commands and responses (see Table 9-2).
- **ID Bytes** identify the packet as an auto-return message packet.
- **Message Report ID** is the report ID returned by the Message Processor T5 object. Note that this is the report ID used in the Object Protocol and should not be confused with the HID-I^{2}C report ID. Refer to the *mXT640U 1.1 Protocol Guide* for more information on the use of Object Protocol report IDs.
- **Message Data** bytes are the bytes of data returned by the Message Processor T5 object. The size of the data depends on the source object for which this is the message data. Any unused bytes are padded with zeros. Refer to the *mXT640U 1.1 Protocol Guide* for more information on the messages from the various objects.

To stop the sending of the messages, the host can send a null command packet. This consists of two bytes: the HID-I^{2}C report ID for Object Protocol commands and responses (see Table 9-2) and a null command byte of 0x00 (see Figure 9-12).

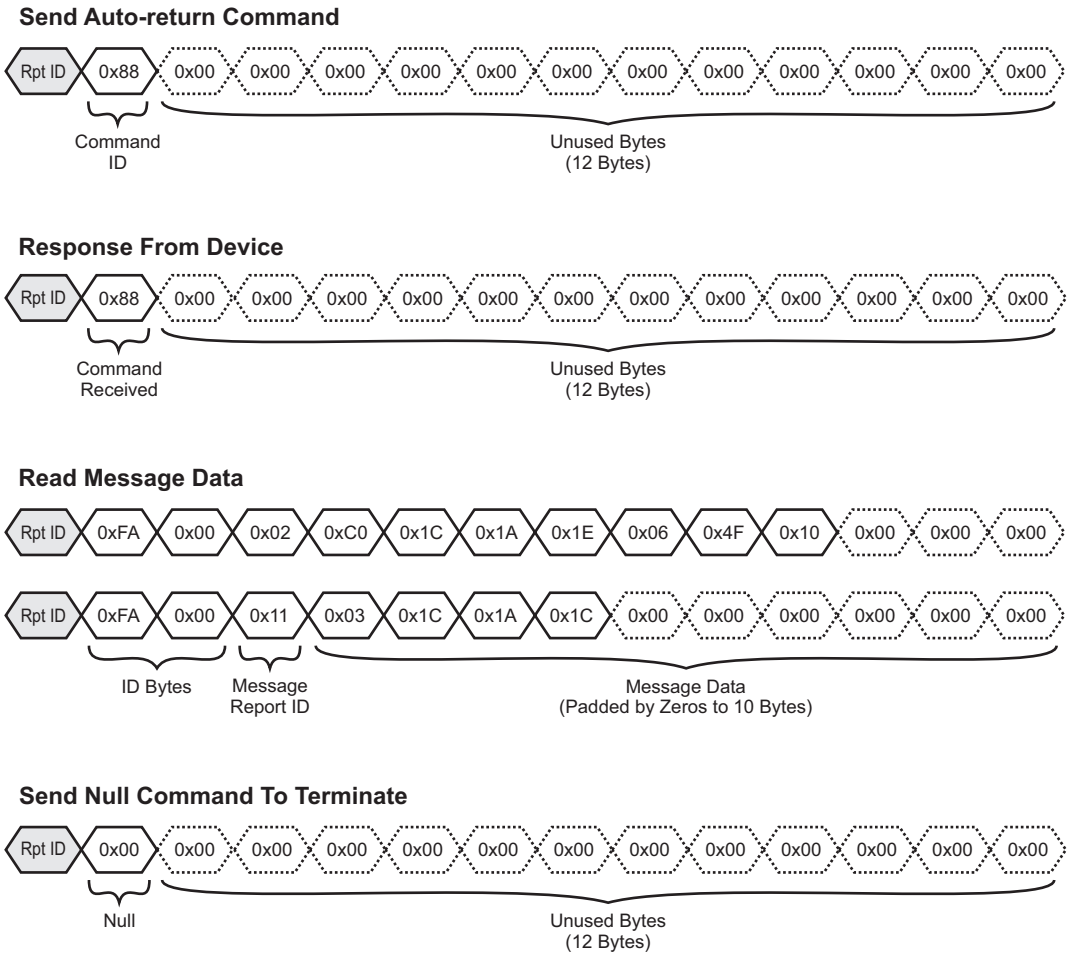
FIGURE 9-12: SEND AUTO-RETURN – NULL COMMAND PACKET FORMAT



Note that any standard read or write operation will also terminate any currently enabled auto-return mode (see Section 9.5.1 “Read/Write Memory Map Command”).

Figure 9-13 shows an example sequence of packets to receive messages from the Message Processor T5 object using the Send Auto-return command.

FIGURE 9-13: SEND AUTO-RETURN – EXAMPLE SEQUENCE



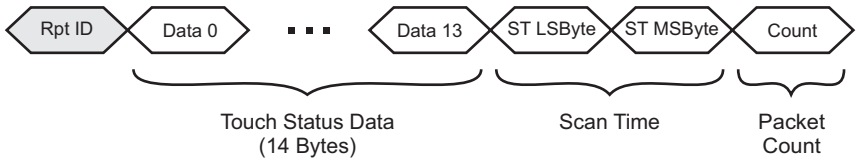
9.6 Digitizer HID-I²C

This is a digitizer class HID.

9.6.1 TOUCH REPORT

The format of a Touch report is shown in Figure 9.6.2. Each Touch report is 18 bytes long and contains the data for one touch.

9.6.2 TOUCH REPORT PACKET FORMAT

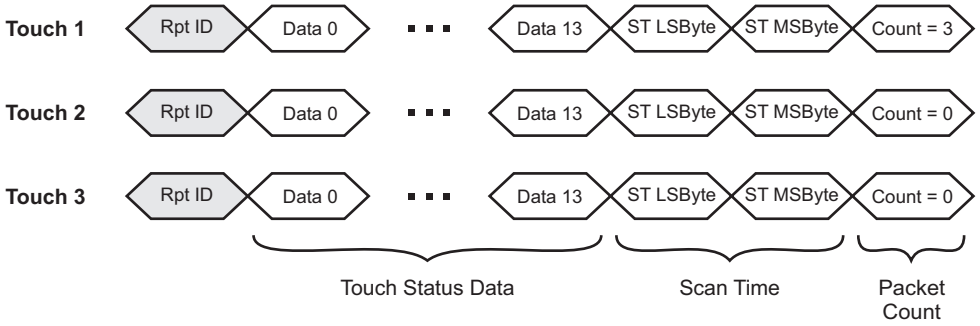


In Figure 9.6.2:

- **Rpt ID** is the HID-I²C report ID used for Touch reports (see Table 9-2).
- **Touch** is the data for the touch.
- **Scan Time** is the Timestamp for the report packet
- **Count** is used to identify the report packets for current active touches that are to be reported as a single package. The Count in the first packet for the first touch is set to the number of active touches to be sent in one package (that is, the number of packets). Subsequent packets for subsequent active touches have a Count of 0.

An example of the Touch report packets for 3 active touches is shown in Figure 9-14.

FIGURE 9-14: EXAMPLE TOUCH REPORT PACKETS FOR 3 ACTIVE TOUCHES



Each input report consists of a HID-I²C report ID followed by 17 bytes that describe the status of one active touch. The input report format depends on the geometry calculation control (TCHGEOMEN) of the Digitizer HID Configuration T43 object. Table 9-3 and Table 9-4 give the detailed format of a touch report packet.

TABLE 9-3: TOUCH REPORT FORMAT WHEN TCHGEOMEN = 1

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	HID-I²C Touch Report ID							
1	Reserved							Status
2	Touch ID							
3	Touch X Position LSByte (first touch)							
4	Reserved				Touch X Position MSBits (first touch)			
5	Touch Center X Position LSByte (first touch)							
6	Reserved				Touch Center X Position MSBits (first touch)			
7	Touch Y Position LSByte (first touch)							
8	Reserved				Touch Y Position MSBits (first touch)			
9	Touch Center Y Position LSByte (first touch)							
10	Reserved				Touch Center Y Position MSBits (first touch)			

TABLE 9-3: TOUCH REPORT FORMAT WHEN TCHGEOMEN = 1 (CONTINUED)

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
11	Touch Width							
12	Reserved							
13	Touch Height							
14	Reserved							
15	Scan Time LSByte							
16	Scan Time MSByte							
17	Packet Count							

TABLE 9-4: TOUCH REPORT FORMAT WHEN TCHGEOMEN = 0

Byte	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
0	HID-I^{2}C Touch Report ID							
1	Reserved							Status
2	Touch ID							
3	Touch X Position LSByte (first touch)							
4	Reserved				Touch X Position MSBits (first touch)			
5	Reserved							
6	Reserved							
7	Touch Y Position LSByte (first touch)							
8	Reserved				Touch Y Position MSBits (first touch)			
9	Reserved							
10	Reserved							
11	Reserved							
12	Reserved							
13	Reserved							
14	Reserved							
15	Scan Time LSByte							
16	Scan Time MSByte							
17	Packet Count							

- Byte 0:
  The HID-I^{2}C report ID (see Table 9-2 for Touch reports).
- Byte 1:
  Status is the status of the touch detection. This bit is set to 1 if touch is detected, and set to 0, if no touches are detected.
- Byte 2:
  Touch ID identifies the touch for which this is a status report (starting from 0).
- Bytes 3 to 10:
  X and Y positions identify the touch position. These are scaled to 12-bit resolution. This means that the upper four bits of the MSByte will always be zero. Bytes 5, 6, 9 and 10 are reserved when TCHGEOMEN field is set to 0.
- Byte 11:
  Touch Width reports the width of the detected touch when TCHGEOMEN is set to 1.
  Reserved when TCHGEOMEN is set to 0
- Byte 13:
  Touch Height reports the height of the detected touch when TCHGEOMEN is set to 1.
  Reserved when TCHGEOMEN is set to 0
- Byte 15 to 16:
  Scan Time is the timestamp associated with the current report packet (10 kHz resolution).
- Byte 17:
  Count is the number of active touches to be sent in one package, for the first touch only. Subsequent packets for subsequent active touches have a Count of 0.

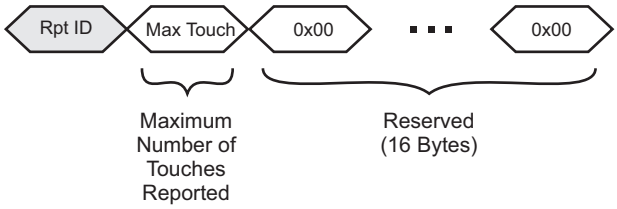
9.6.3 MAXIMUM TOUCHES REPORT

Read this report to receive the maximum number of touches (surface contacts) that can currently be reported.

Write this report to set the maximum number of touches to be reported.

The format of the Maximum Touches report packet is shown in Figure 9-15. Each Maximum Touch report is 18 bytes long and contains a single byte giving the maximum number of touches to be reported.

FIGURE 9-15: MAXIMUM TOUCHES REPORT FORMAT



In Figure 9-15:

- **Rpt ID** is the HID-I^{2}C report ID used for Maximum Touches reports (see Table 9-2).
- **Max Touch** is the maximum number of touches to be reported by the device.

NOTE	The number of touches cannot be set to more than the maximum number of touches defined by Multiple Touch Touchscreen T100 NUMTCH. Refer to the *mXT640U 1.1 Protocol Guide* for more information on this field.

9.6.4 TOUCH HARDWARE QUALITY ASSURANCE (THQA) REPORT

The THQA data is reported to Microsoft Windows using the THQA report ID (see Table 9-2 for the value). The content of this data is defined by Microsoft.

9.7 $\overline{\text{CHG}}$ Line

The $\overline{\text{CHG}}$ line is used to implement the HID-I^{2}C interrupt line. It provides a level triggered interrupt to the host to indicate when there is one or more reports to be read. The $\overline{\text{CHG}}$ line will be pulled low when a report is ready and will remain low as long as there are further reports to be read. Once the last report is read the $\overline{\text{CHG}}$ line will go high.

NOTE	In order to comply with the HID-I^{2}C specification, Communications Configuration T18 MODE should be set to 0.

9.8 SDA, SCL

Identical to standard I^{2}C operation. See Section 8.7 “SDA and SCL”.

9.9 Clock Stretching

Identical to standard I^{2}C operation. See Section 8.8 “Clock Stretching”.

9.10 Power Control

The mXT640U supports the use of the HID-I^{2}C *SET POWER* commands to put the device into a low power state

9.11 Microsoft Windows Compliance

The mXT640U has algorithms within the Multiple Touch Touchscreen T100 object specifically to ensure compliance with Microsoft Windows 8.x and later versions.

The device also supports Microsoft Touch Hardware Quality Assurance (THQA) in the Serial Data Command T68 object. Refer to the Microsoft whitepaper *How to Design and Test Multitouch Hardware Solutions for Windows 8*.

These, and other device features, may need specific tuning.

10.0 PCB DESIGN CONSIDERATIONS

10.1 Introduction

The following sections give the design considerations that should be adhered to when designing a PCB layout for use with the mXT640U. Of these, power supply and ground tracking considerations are the most critical.

By observing the following design rules, and with careful preparation for the PCB layout exercise, designers will be assured of a far better chance of success and a correctly functioning product.

10.2 Printed Circuit Board

Microchip recommends the use of a four-layer printed circuit board for mXT640U applications. This, together with careful layout, will ensure that the board meets relevant EMC requirements for both noise radiation and susceptibility, as laid down by the various national and international standards agencies.

10.2.1 PCB CLEANLINESS

Modern no-clean-flux is generally compatible with capacitive sensing circuits.

CAUTION!	If a PCB is reworked to correct soldering faults relating to any device, or to any associated traces or components, be sure that you fully understand the nature of the flux used during the rework process. Leakage currents from hygroscopic ionic residues can stop capacitive sensors from functioning. If you have any doubts, a thorough cleaning after rework may be the only safe option.

10.3 Power Supply

10.3.1 SUPPLY QUALITY

While the device has good Power Supply Rejection Ratio properties, poorly regulated and/or noisy power supplies can significantly reduce performance.

Particular care should be taken of the AVdd supply, as it supplies the sensitive analog stages in the device.

10.3.2 SUPPLY RAILS AND GROUND TRACKING

Power supply and clock distribution are the most critical parts of any board layout. Because of this, it is advisable that these be completed before any other tracking is undertaken. After these, supply decoupling, and analog and high speed digital signals should be addressed. Track widths for all signals, especially power rails should be kept as wide as possible in order to reduce inductance.

The Power and Ground planes themselves can form a useful capacitor. Flood filling for either or both of these supply rails, therefore, should be used where possible. It is important to ensure that there are no floating copper areas remaining on the board: all such areas should be connected to the ground plane. The flood filling should be done on the outside layers of the board.

10.3.3 POWER SUPPLY DECOUPLING

Decoupling capacitors should be fitted as specified in Section 2.2 “Schematic Notes”.

The decoupling capacitors must be placed as close as possible to the pin being decoupled. The traces from these capacitors to the respective device pins should be wide and take a straight route. They should be routed over a ground plane as much as possible. The capacitor ground pins should also be connected directly to a ground plane.

Surface mounting capacitors are preferred over wire-leaded types due to their lower ESR and ESL. It is often possible to fit these decoupling capacitors underneath and on the opposite side of the PCB to the digital ICs. This will provide the shortest tracking, and most effective decoupling possible.

10.3.4 VOLTAGE PUMP

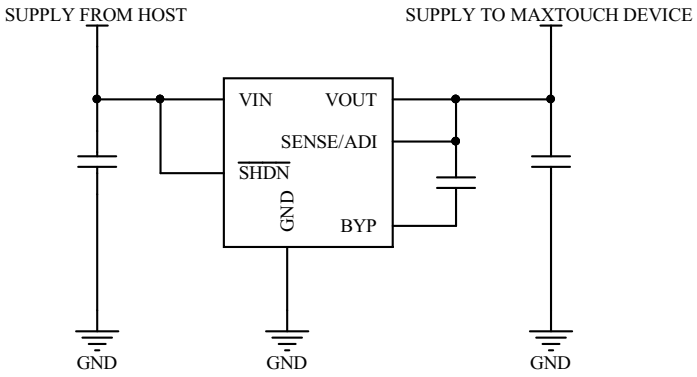
The voltage pump capacitors between EXTCAP0 and EXTCAP3 and between EXTCAP1 and EXTCAP2 (Cd and Ct on the schematic in Section 2.0 “Schematics”) must be placed as close as possible to the EXTCAP*n* pins. The two traces for each capacitor must be kept as short and as wide as possible for best pump performance. They should also be routed as parallel and as close as possible to each other in order to reduce emissions, and ideally both traces should be the same length.

10.4 Voltage Regulators

Each supply rail requires a Low Drop-Out (LDO) voltage regulator, although an LDO can be shared where supply rails share the same voltage level.

Figure 10-1 shows an example circuit for an LDO.

FIGURE 10-1: EXAMPLE LDO CIRCUIT



An LDO regulator should be chosen that provides adequate output capability, low noise, good load regulation and step response. The voltage regulators listed in Table 10-1 have been tested and found to work well with maXTouch devices. If it is desired to use an alternative LDO, however, certain performance criteria should be verified before using the device. These are:

- Stable with high value multi-layer ceramic capacitors on the output
- Low output noise – less than 100 µV RMS over the range 10 Hz to 1 MHz
- Good load transient response – this should be less than 35 mV peak when a load step change of 100 mA is applied at the device output terminal
- No-load stable – Some LDOs become unstable if the output current falls below a certain minimum. If this is the case, then this minimum must be lower than the minimum current consumed by the mXT640U (for example, in deep sleep).

TABLE 10-1: SUITABLE LDO REGULATORS

Manufacturer	Device	Current Rating (mA)
Microchip Technology Inc.	MCP1824	300
Microchip Technology Inc.	MCP1824S	300
Microchip Technology Inc.	MAQ5300	300
Microchip Technology Inc.	MCP1725	500
Microchip Technology Inc.	MIC5323	300
Analog Devices	ADP122/ADP123	300
Diodes Inc.	AP2125	300
Diodes Inc.	AP7335	300
Linear Technology	LT1763CS8-3.3	500
NXP	LD6836	300
Texas Instruments	LP3981	300

Note: Some manufacturers claim that minimal or no capacitance is required for correct regulator operation. However, in all cases, a minimum of a 1.0 µF ceramic, low ESR capacitor at the input and output of these devices should be used. The manufacturer's datasheets should always be referred to when selecting capacitors for these devices and the typical recommended values, types and dielectrics adhered to.

10.4.1 SINGLE SUPPLY OPERATION

When designing a PCB for an application using a single LDO, extra care should be taken to ensure short, low inductance traces between the supply and the touch controller supply input pins. Ideally, tracking for the individual supplies should be arranged in a star configuration, with the LDO at the junction of the star. This will ensure that supply current variations or noise in one supply rail will have minimum effect on the other supplies. In applications where a ground plane is not practical, this same star layout should also apply to the power supply ground returns.

Only regulators with a 300 mA or greater rating can be used in a single-supply design.

Refer to the following application note for more information on routing with a single LDO:

- Application Note: MXTAN0208 – *Design Guide for PCB Layouts for maXTouch Touch Controllers*

10.4.2 MULTIPLE VOLTAGE REGULATOR SUPPLY

The AVdd supply stability is critical for the device because this supply interacts directly with the analog front end. If noise problems exist when using a single LDO regulator, Microchip recommends that AVdd is supplied by a regulator that is separate from the digital supply. This reduces the amount of noise injected into the sensitive, low signal level parts of the design.

10.5 Analog I/O

In general, tracking for the analog I/O signals from the device should be kept as short as possible. These normally go to a connector which interfaces directly to the touchscreen.

Ensure that adequate ground-planes are used. An analog ground plane should be used in addition to a digital one. Care should be taken to ensure that both ground planes are kept separate and are connected together only at the point of entry for the power to the PCB. This is usually at the input connector.

10.6 Component Placement and Tracking

It is important to orient all devices so that the tracking for important signals (such as power and clocks) are kept as short as possible.

10.6.1 DIGITAL SIGNALS

In general, when tracking digital signals, it is advisable to avoid sharp directional changes on sensitive signal tracks (such as analog I/O) and any clock or crystal tracking.

A good ground return path for all signals should be provided, where possible, to ensure that there are no discontinuities.

10.7 EMC and Other Observations

The following recommendations are not mandatory, but may help in situations where particularly difficult EMC or other problems are present:

- Try to keep as many signals as possible on the inside layers of the board. If suitable ground flood fills are used on the top and bottom layers, these will provide a good level of screening for noisy signals, both into and out of the PCB.
- Ensure that the on-board regulators have sufficient tracking around and underneath the devices to act as a heatsink. This heatsink will normally be connected to the 0 V or ground supply pin. Increasing the width of the copper tracking to any of the device pins will aid in removing heat. There should be no solder mask over the copper track underneath the body of the regulators.
- Ensure that the decoupling capacitors, especially high capacity ceramic type, have the requisite low ESR, ESL and good stability/temperature properties. Refer to the regulator manufacturer’s datasheet for more information.

11.0 GETTING STARTED WITH MXT640U

11.1 Establishing Contact

11.1.1 COMMUNICATION WITH THE HOST

The host can use the following interfaces to communicate with the device:

- I^2C interface (see Section 8.0 “I2C Communications”)
- HID-I^2C interface (see Section 9.0 “HID-I^2C Communications”)

Any interface available on the device can be used. See Section 7.0 “Host Communications” for more information.

11.1.2 POWER-UP SEQUENCE

On power-up, the $\overline{CHG}$ line goes low to indicate that there is new data to be read from the device. If the $\overline{CHG}$ line does not go low, there is a problem with the device.

Once the $\overline{CHG}$ line goes low, the host should attempt to read the first 7 bytes of memory from location 0x00 to establish that the device is present and running following power-up.

A checksum check is performed on the configuration settings held in the nonvolatile memory. If the checksum does not match a stored copy of the last checksum, then this indicates that the settings have become corrupted. This is signaled to the host by setting the configuration error bit in the message data for the Command Processor T6 object.

11.2 Using the Object Protocol

The device has an object-based protocol that is used to communicate with the device. Typical communication includes configuring the device, sending commands to the device, and receiving messages from the device.

The host must perform the following initialization so that it can communicate with the device:

1. Read the start positions of all the objects in the device from the Object Table and build up a list of these addresses.
2. Use the Object Table to calculate the report IDs so that messages from the device can be correctly interpreted.

11.2.1 CLASSES OF OBJECTS

The mXT640U contains the following classes of objects:

- **Debug objects** – provide a raw data output method for development and testing.
- **General objects** – required for global configuration, transmitting messages and receiving commands.
- **Touch objects** – operate on measured signals from the touch sensor and report touch data.
- **Signal processing objects** – process data from other objects (typically signal filtering operations).
- **Support objects** – provide additional functionality on the device.

11.2.2 OBJECT INSTANCES

TABLE 11-1: OBJECTS ON THE MXT640U

Object	Description	Number of Instances	Usage
Debug Objects			
Diagnostic Debug T37	Allows access to diagnostic debug data to aid development.	1	Debug commands only. No configuration/tuning necessary. Not for use in production.
General Objects			
Message Processor T5	Handles the transmission of messages. This object holds a message in its memory space for the host to read.	1	No configuration necessary.
Command Processor T6	Performs a command when written to. Commands include reset, calibrate and backup settings.	1	No configuration necessary.

TABLE 11-1: OBJECTS ON THE MXT640U (CONTINUED)

Object	Description	Number of Instances	Usage
Power Configuration T7	Controls the sleep mode of the device. Power consumption can be lowered by controlling the acquisition frequency and the sleep time between acquisitions.	1	Must be configured before use.
Acquisition Configuration T8	Controls how the device takes each capacitive measurement.	1	Must be configured before use.
Touch Objects			
Key Array T15	Creates a rectangular array of keys. A Key Array T15 object reports simple on/off touch information.	1	Enable and configure as required.
Multiple Touch Touchscreen T100	Creates a Touchscreen that supports the tracking of more than one touch.	1	Enable and configure as required.
Signal Processing Objects			
Grip Suppression T40	Suppresses false detections caused, for example, by the user gripping the edge of the touchscreen.	1	Enable and configure as required.
Touch Suppression T42	Suppresses false detections caused by unintentional large touches by the user.	1	Enable and configure as required.
Passive Stylus T47	Processes passive stylus input.	1	Enable and configure as required.
Shieldless T56	Allows a sensor to use true single-layer co-planar construction.	1	Enable and configure as required.
Lens Bending T65	Compensates for lens deformation (lens bending) by attempting to eliminate the disturbance signal from the reported deltas.	3	Enable and configure as required.
Noise Suppression T72	Performs various noise reduction techniques during touchscreen signal acquisition.	1	Enable and configure as required.
Glove Detection T78	Allows for the reporting of glove touches.	1	Enable and configure as required.
Retransmission Compensation T80	Limits the negative effects on touch signals caused by poor device coupling to ground.	1	Enable and configure as required.
Unlock Gesture T81	Sends a message when a gesture satisfies the configuration settings for use in wake up or unlock situations.	2	Enable and configure as required.
Touch Sequence Processor T93	Captures a sequence of touch and release locations to allow double taps to be detected.	1	Enable and configure as required.
Self Capacitance Noise Suppression T108	Suppresses the effects of external noise within the context of self capacitance touch measurements.	1	Enable and configure as required.
Self Capacitance Grip Suppression T112	Allows touches to be reported from the self capacitance measurements while the device is being gripped.	1	Enable and configure as required.
Symbol Gesture Processor T115	Detects arbitrary shaped gestures as a series of ordinal strokes. These are typically symbols drawn by the user for interpretation by the host as wake-up gestures or other application triggers.	1	Enable and configure as required.

TABLE 11-1: OBJECTS ON THE MXT640U (CONTINUED)

Object	Description	Number of Instances	Usage
Sensor Correction T121	Allows adjustments to be made to mutual measurements from an associated touchscreen sensor.	1	Enable and configure as required.
Support Objects			
Communications Configuration T18	Configures additional communications behavior for the device.	1	Check and configure as necessary.
GPIO Configuration T19	Allows the host controller to configure and use the general purpose I/O pins on the device.	1	Enable and configure as required.
Self Test T25	Configures and performs self-test routines to find faults on a touch sensor.	1	Configure as required for pin test commands.
User Data T38	Provides a data storage area for user data.	1	Configure as required.
Digitizer HID Configuration T43	Configures the Digitizer HID interface and the Descriptors associated with it.	1	Enable and configure as required.
Message Count T44	Provides a count of pending messages.	1	Read-only object.
CTE Configuration T46	Controls the capacitive touch engine for the device.	1	Must be configured.
Timer T61	Provides control of a timer.	6	Enable and configure as required.
Serial Data Command T68	Provides an interface for the host driver to deliver various data sets to the device.	1	Enable and configure as required.
Dynamic Configuration Controller T70	Allows rules to be defined that respond to system events.	20	Enable and configure as required.
Dynamic Configuration Container T71	Allows the storage of user configuration on the device that can be selected at runtime based on rules defined in the Dynamic Configuration Controller T70 object.	1	Configure if Dynamic Configuration Controller T70 is in use.
CTE Scan Configuration T77	Configures enhanced X line scanning features.	1	Enable and configure as required.
Touch Event Trigger T79	Configures touch triggers for use with the event handler.	3	Enable and configure as required.
Auxiliary Touch Configuration T104	Allows the setting of self capacitance gain and thresholds for a particular measurement to generate auxiliary touch data for use by other objects.	1	Enable and configure if using self capacitance measurements
Self Capacitance Global Configuration T109	Provides configuration for a self capacitance measurements employed on the device.	1	Check and configure as required (if using self capacitance measurements).
Self Capacitance Tuning Parameters T110	Provides configuration space for a generic set of settings for self capacitance measurements.	12	Use under the guidance of Microchip field engineers only.
Self Capacitance Configuration T111	Provides configuration for self capacitance measurements employed on the device.	2	Check and configure as required (if using self capacitance measurements).

TABLE 11-1: OBJECTS ON THE MXT640U (CONTINUED)

Object	Description	Number of Instances	Usage
Self Capacitance Measurement Configuration T113	Configures self capacitance measurements to generate data for use by other objects.	1	Enable and configure as required.
Symbol Gesture Configuration T116	Stores configuration data that defines the symbols to be detected by the Symbol Gesture Processor T115 object.	1	Configure if Symbol Gesture Processor T115 is in use.
Message Filter T132	Filters messages from the T5 Object	1	Enable and configure as required.

11.2.3 CONFIGURING AND TUNING THE DEVICE

The objects are designed such that a default value of zero in their fields is a “safe” value that typically disables functionality. The objects must be configured before use and the settings written to the non-volatile memory using the Command Processor T6 object.

Perform the following actions for each object:

1. Enable the object, if the object requires it.
2. Configure the fields in the object, as required.
3. Enable reporting, if the object supports messages, to receive messages from the object.

11.3 Writing to the Device

The following mechanisms can be used to write to the device:

- Using an I^2C write operation (see Section 8.2 “Writing To the Device”).
- Using the Generic HID-I^2C write operation (see Section 9.5.1.2 “Writing To the Device”).

Communication with the device is achieved by writing to the appropriate object:

- To send a command to the device, an appropriate command is written to the Command Processor T6 object.
- To configure the device, a configuration parameter is written to the appropriate object. For example, writing to the Power Configuration T7 configures the power consumption for the device and writing to the touchscreen Multiple Touch Touchscreen T100 object sets up the touchscreen. Some objects are optional and need to be enabled before use.

IMPORTANT!	When the host issues any command within an object that results in a flash write to the device Non-Volatile Memory (NVM), that object should have its CTRL RPTEN bit set to 1, if it has one. This ensures that a message from the object writing to the NVM is generated at the completion of the process and an assertion of the $\overline{\text{CHG}}$ line is executed. The host must also ensure that the assertion of the $\overline{\text{CHG}}$ line refers to the expected object report ID before asserting the $\overline{\text{RESET}}$ line to perform a reset. Failure to follow this guidance may result in a corruption of device configuration area and the generation of a CFGERR.

11.4 Reading from the Device

Status information is stored in the Message Processor T5 object. This object can be read to receive any status information from the device. The following mechanisms provide an interrupt-style interface for reading messages in the Message Processor T5 object:

- The $\overline{\text{CHG}}$ line is asserted whenever a new message is available in the Message Processor T5 object (see Section 8.6 “CHG Line”). See Section 8.4 “Reading From the Device” for information on the format of the I^2C read operation.
- When using the HID-I^2C interface, the interface provides an interrupt-driven interface that sends the messages automatically (see Section 9.5.1.3 “Reading From the Device”)

Note that the host should always wait to be notified of messages. The host should not poll the device for messages.

12.0 DEBUGGING AND TUNING

12.1 SPI Debug Interface

The SPI Debug Interface is used for tuning and debugging when running the system and allows the development engineer to use Microchip maXTouch Studio to read the real-time raw data. This uses the low-level debug port, accessed via the SPI interface.

The SPI Debug Interface consists of the $\overline{\text{DBG\_SS}}$, DBG_CLK, and DBG_DATA lines. It is recommended that these pins are routed to test points on all designs such that they can be connected to external hardware during system development. These lines should not be connected to power or GND. See Section 2.2.9 “SPI Debug Interface” for more details.

The SPI Debug Interface is enabled by the Command Processor T6 object and by default will be off.

NOTE	The touch controller will take care of the pin configuration. When the $\overline{\text{DBG\_SS}}$, DBG_CLK, and DBG_DATA lines are in use for debugging, any alternative function for the pins cannot be used.

12.2 Secondary Debug Interface

This interface is used for low-level debugging when developing the system.

The interface consists of the DBG2_CLK, DBG2_FRAME and DBG2_DATA0 to DBG2_DATA5 lines.

These pins should be routed to test points on designs where a new sensor or display technology is being used, or if the design will use an active stylus. These lines should not be connected to power or GND.

The touch controller will take care of the pin configuration. When these lines are in use, any alternative function for the pins cannot be used.

The secondary interface is enabled by a special firmware build and by default will be off.

12.3 Object-based Protocol

The device provides a mechanism for obtaining debug data for development and testing purposes by reading data from the Diagnostic Debug T37 object.

NOTE	The Diagnostic Debug T37 object is of most use for simple tuning purposes. When debugging a design, it is preferable to use the SPI Debug Interface, as this will have a much higher bandwidth and can provide real-time data.

12.4 Self Test

There is a Self Test T25 object that runs self-test routines in the device to find hardware faults on the sense lines and the electrodes. This object also performs an initial pin fault test on power-up to ensure that there is no X-to-Y short before the high-voltage supply is enabled inside the chip. A high-voltage short on the sense lines would break the device.

13.0 SPECIFICATIONS

13.1 Absolute Maximum Specifications

Vdd	3.6 V
VddIO	3.6 V
AVdd	3.6 V
Maximum continuous combined pin current, all GPIO*n* pins	40 mA
Voltage forced onto any pin	–0.3 V to (Vdd, VddIO or AVdd) + 0.3 V
Configuration parameters maximum writes	10,000
Maximum junction temperature	125°C

CAUTION! Stresses beyond those listed under *Absolute Maximum Specifications* may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum specification conditions for extended periods may affect device reliability.

13.2 Recommended Operating Conditions

Operating temperature	–40°C to +85°C
Storage temperature	–60°C to +150°C
Vdd	3.3 V
VddIO	1.8 V to 3.3 V
AVdd	3.3 V
XVdd with internal voltage doubler	Vdd to 2 × Vdd
XVdd with internal voltage tripler	Vdd to 3 × Vdd
Temperature slew rate	10°C/min

13.2.1 DC CHARACTERISTICS

13.2.1.1 Analog Voltage Supply – AVdd

Parameter	Min	Typ	Max	Units	Notes
AVdd					
Operating limits	2.7	3.3	3.6	V	
Supply Rise Rate	–	–	0.25	V/µs	For example, for a 3.3 V rail, the voltage must not rise in less than 13.2 µs

13.2.1.2 Digital Voltage Supply – Vdd, VddIO

Parameter	Min	Typ	Max	Units	Notes
VddIO					
Operating limits	1.71	3.3	3.47	V	I^2C
Supply Rise Rate	–	–	0.25	V/µs	For example, for a 3.3 V rail, the voltage must not rise in less than 13.2 µs
Vdd					
Operating limits	2.7	3.3	3.6	V	
Supply Rise Rate	–	–	0.25	V/µs	For example, for a 3.3 V rail, the voltage must not rise in less than 13.2 µs
Supply Fall Rate	–	–	0.05	V/µs	For example, for a 3.3 V rail, the voltage must not fall in less than 66 µs

13.2.1.3 XVdd Voltage Supply – XVdd

Parameter	Min	Typ	Max	Units	Notes
XVdd					
Operating limits	Vdd	–	2 × Vdd	V	Maximum value with internal voltage doubler
Operating limits	Vdd	–	3 × Vdd	V	Maximum value with internal voltage tripler

13.2.2 POWER SUPPLY RIPPLE AND NOISE

Parameter	Min	Typ	Max	Units	Notes
Vdd	–	–	±50	mV	Across frequency range 1 Hz to 1 MHz
AVdd	–	–	±40	mV	Across frequency range 1 Hz to 1 MHz, with Noise Suppression enabled

13.3 Test Configuration

The values listed below were used in the reference unit to validate the interfaces and derive the characterization data provided in the following sections.

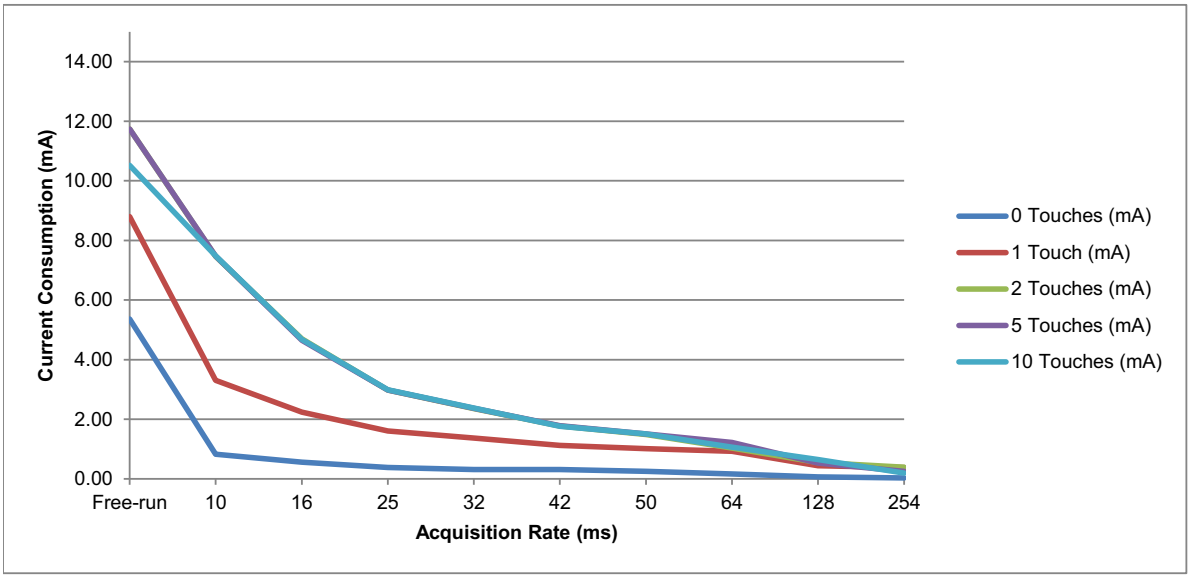
TABLE 13-1: TEST CONFIGURATION

Object/Parameter	Description/Setting (Numbers in Decimal)
Acquisition Configuration T8	
CHRGTIME	44
MEASALLOW	11
MEASIDLEDEF	8
MEASACTVDEF	2
GPIO Configuration T19	Object Enabled
CTE Configuration T46	
IDLESYNCSPERX	16
ACTVSYNCSPERX	16
Shieldless T56	Object Enabled
INTTIME	27
Lens Bending T65 Instance 0	Object Enabled
Noise Suppression T72	Object Enabled
CTE Scan Configuration T77	Object Enabled
Glove Detection T78	Object Enabled
Retransmission Compensation T80	Object Enabled
Multiple Touch Touchscreen T100	Object Enabled
XSIZE	32
YSIZE	20
Auxiliary Touch Configuration T104	Object Enabled
Self Capacitance Noise Suppression T108	Object Enabled
Self Capacitance Configuration T111 Instance 0	
INTTIME	50
IDLESYNCSPERL	24
ACTVSYNCSPERL	24
Self Capacitance Configuration T111 Instance 1	
INTTIME	50
IDLESYNCSPERL	32
ACTVSYNCSPERL	32
Self Capacitance Measurement Configuration T113	Object Enabled

13.4 Supply Current

13.4.1 ANALOG SUPPLY

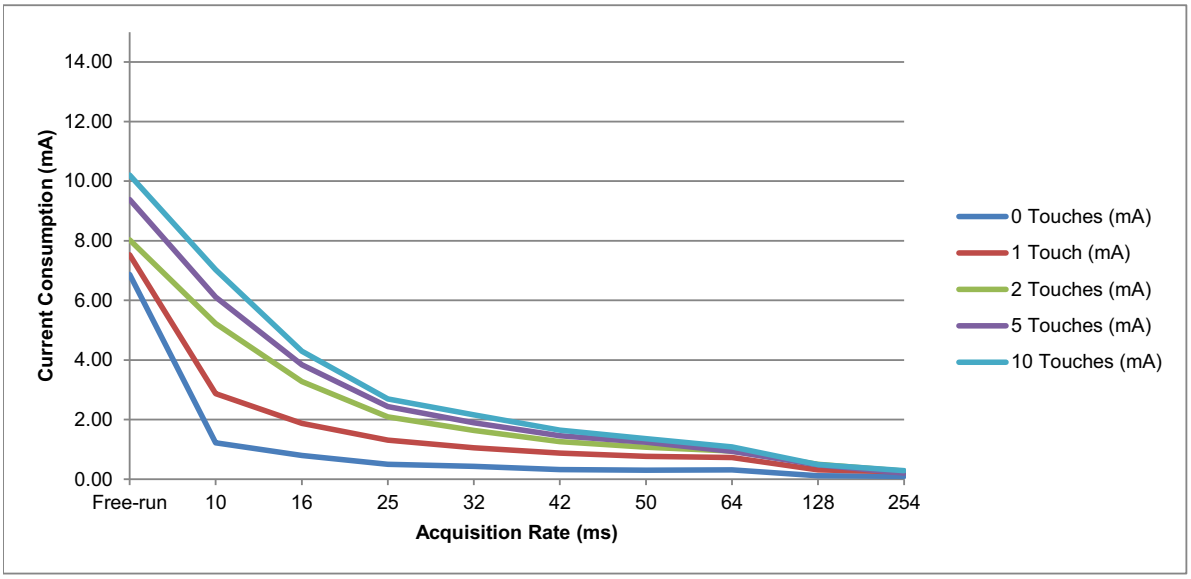
Acquisition Rate (ms)	0 Touches (mA)	1 Touch (mA)	2 Touches (mA)	5 Touches (mA)	10 Touches (mA)
Free-run	5.36	8.80	11.74	11.74	10.52
10	0.82	3.30	7.46	7.47	7.49
16	0.56	2.24	4.70	4.65	4.68
25	0.38	1.61	2.98	2.98	2.99
32	0.31	1.37	2.36	2.37	2.38
42	0.31	1.13	1.78	1.78	1.77
50	0.26	1.02	1.49	1.50	1.51
64	0.17	0.93	1.03	1.23	1.06
128	0.07	0.45	0.55	0.53	0.65
254	0.03	0.38	0.39	0.25	0.19



13.4.2 DIGITAL SUPPLY

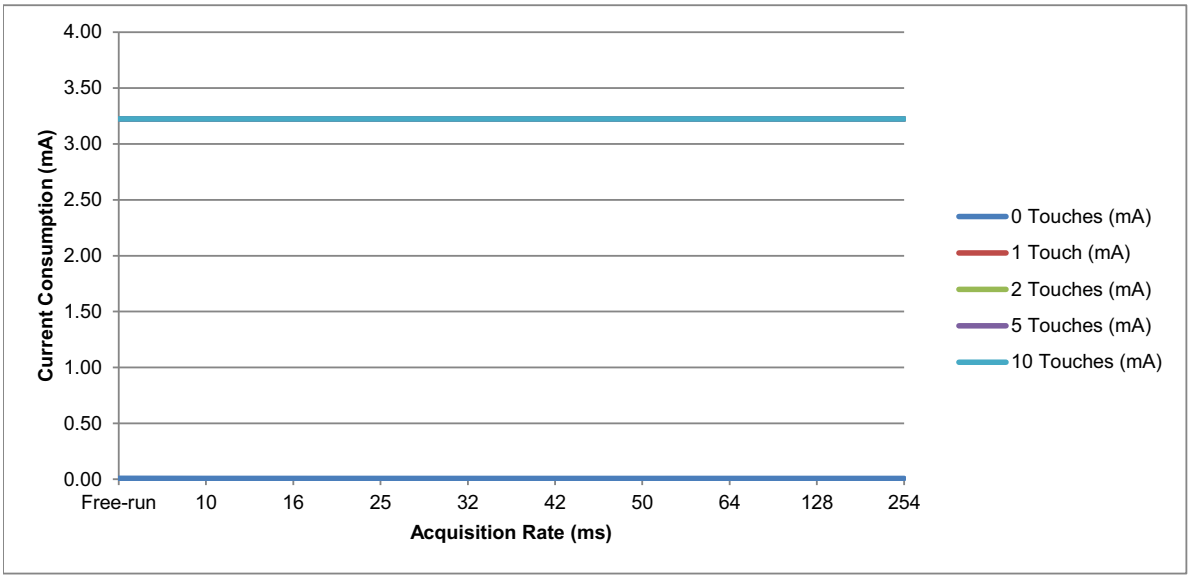
13.4.2.1 Vdd

Acquisition Rate (ms)	0 Touches (mA)	1 Touch (mA)	2 Touches (mA)	5 Touches (mA)	10 Touches (mA)
Free-run	6.87	7.53	8.03	9.39	10.21
10	1.22	2.88	5.23	6.11	7.03
16	0.80	1.87	3.28	3.84	4.29
25	0.50	1.31	2.09	2.44	2.69
32	0.43	1.06	1.64	1.89	2.16
42	0.33	0.88	1.26	1.46	1.65
50	0.30	0.77	1.07	1.24	1.36
64	0.31	0.73	0.95	0.94	1.09
128	0.11	0.31	0.50	0.48	0.49
254	0.10	0.25	0.27	0.21	0.29



13.4.2.2 VddIO

Acquisition Rate (ms)	0 Touches (mA)	1 Touch (mA)	2 Touches (mA)	5 Touches (mA)	10 Touches (mA)
Free-run	0.01	3.22	3.22	3.22	3.22
10	0.01	3.22	3.22	3.22	3.22
16	0.01	3.22	3.22	3.22	3.22
25	0.01	3.22	3.22	3.22	3.22
32	0.01	3.22	3.22	3.22	3.22
42	0.01	3.22	3.22	3.22	3.22
50	0.01	3.22	3.22	3.22	3.22
64	0.01	3.22	3.22	3.22	3.22
128	0.01	3.22	3.22	3.22	3.22
254	0.01	3.22	3.22	3.22	3.22



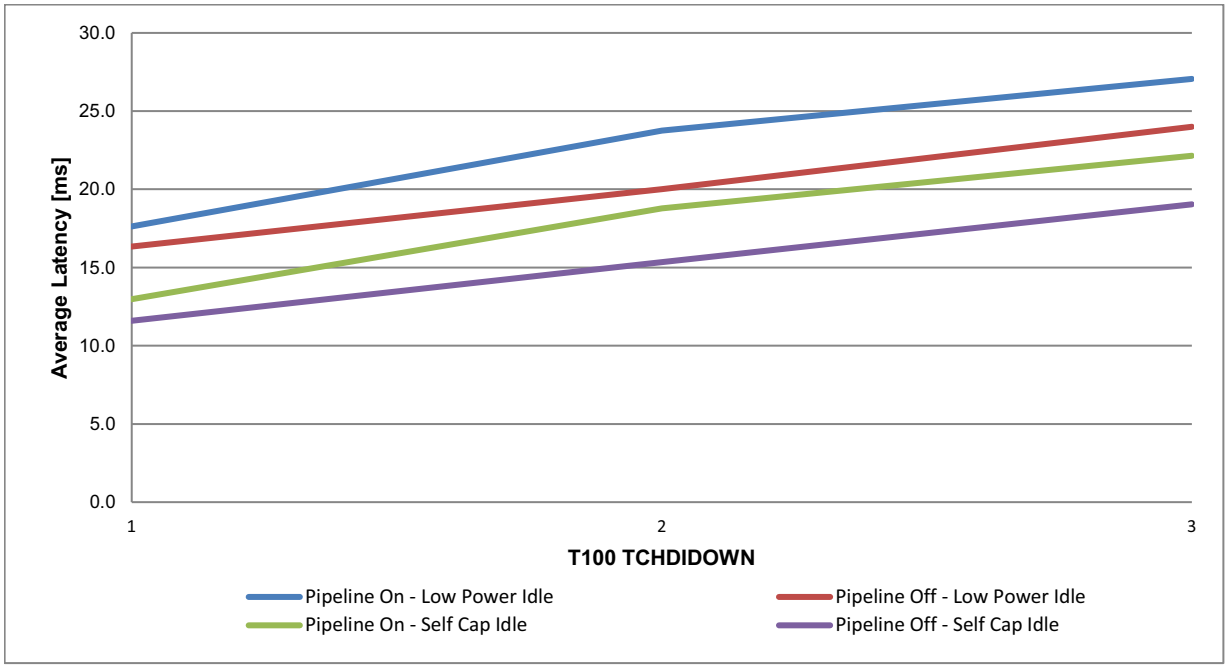
13.5 Deep Sleep Current

T_A = 25°C

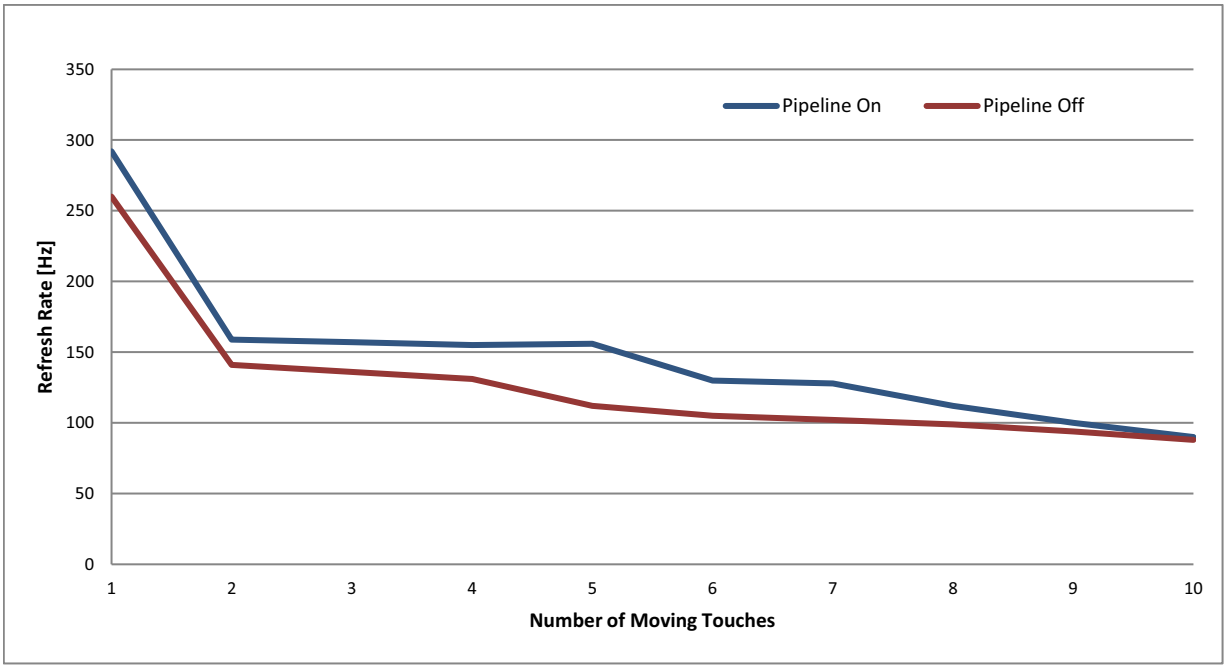
Parameter	Min	Typ	Max	Units	Notes
Deep Sleep Current	–	47	–	µA	Vdd = 3.3 V, AVdd = 3.3 V
Deep Sleep Power	–	150	–	µW	Vdd = 3.3 V, AVdd = 3.3 V

13.6 Timing Specifications

13.6.1 TOUCH LATENCY



13.6.2 REFRESH RATE



13.6.3 RESET TIMINGS

Parameter	Min	Typ	Max	Units	Notes
Power on to $\overline{\text{CHG}}$ line low	–	38	–	ms	Vdd supply for POR VddIO supply for external reset
Hardware reset to $\overline{\text{CHG}}$ line low	–	38	–	ms	
Software reset to $\overline{\text{CHG}}$ line low	–	57	–	ms	

Note 1: Any $\overline{\text{CHG}}$ line activity before the power-on or reset period has expired should be ignored by the host. Operation of this signal cannot be guaranteed before the power-on/reset periods have expired.

2: The mXT640U meets the requirements of Microsoft Windows 8.x and later versions.

13.7 Touchscreen Sensor Characteristics

Parameter	Description	Min	Typ	Max	Units	Notes
Cm	Mutual capacitance	0.15	–	10	pF	Assumes XVdd >= 2 × AVdd. Minimum is 0.3pF with XVdd = AVdd
Cpx	Self capacitance load to X	–	–	100	pF	Single X line
Cpy	Self capacitance load to Y	–	–	100	pF	Single Y line
ΔCpx	Self capacitance imbalance on X	–	–	9.7	pF	Value increases by 1 pF for every 20 pF reduction in Cpx
ΔCpy	Self capacitance imbalance on Y	–	–	9.7	pF	Value increases by 1 pF for every 20 pF reduction in Cpy

13.8 Input/Output Characteristics

Parameter	Description	Min	Typ	Max	Units	Notes
Input (All input pins connected to the VddIO power rail)						
Vil	Low input logic level	–0.3	–	0.3 × VddIO	V	VddIO = 1.8 V to Vdd
Vih	High input logic level	0.7 × VddIO	–	VddIO	V	VddIO = 1.8 V to Vdd
Iil	Input leakage current	–	–	1	µA	Pull-up resistors disabled
$\overline{\text{RESET}}$ pin	Internal pull-up resistor	9	–	16	kΩ	
GPIO pin	Internal pull-up/pull-down resistor					
Output (All output pins connected to the VddIO power rail)						
Vol	Low output voltage	0	–	0.2 × VddIO	V	VddIO = 1.8 V to Vdd Iol = 2 mA
Voh	High output voltage	0.8 × VddIO	–	VddIO	V	VddIO = 1.8 V to Vdd Ioh = –2 mA
GPIO pin	Internal pull-up/pull-down resistor	9	–	16	kΩ	

13.9 I²C Specification

Parameter	Value
Addresses	0x4A or 0x4B
I²C specification	Revision 6.0
Maximum bus speed (SCL) (1)	3.4 MHz
Standard Mode (2)	100 kHz
Fast Mode (2)	400 kHz
Fast Mode Plus (2)	1 MHz
High Speed Mode (2)	3.4 MHz

Note 1: The values of pull-up resistors should be chosen to ensure SCL and SDA rise and fall times meet the I²C specification. The value required will depend on the amount of capacitance loading on the lines.

2: In systems with heavily laden I²C lines, even with minimum pull-up resistor values, bus speed may be limited by capacitive loading to less than the theoretical maximum.

3: More detailed information on I²C operation is available from www.nxp.com/documents/user_manual/UM10204.pdf.

13.10 HID-I²C Specification

Parameter	Value
Vendor ID	0x03EB (Microchip)
Product ID	0x2163 (mXT640U)
HID-I²C specification	1.0

13.11 Touch Accuracy and Repeatability

Parameter	Min	Typ	Max	Units	Notes
Linearity (touch only; 5.4 mm electrode pitch)	–	±1	–	mm	8 mm or greater finger
Linearity (touch only; 4.2 mm electrode pitch)	–	±0.5	–	mm	4 mm or greater finger
Accuracy	–	±1	–	mm	
Accuracy at edge	–	±2	–	mm	
Repeatability	–	±0.25	–	%	X axis with 12-bit resolution

13.12 Thermal Packaging

13.12.1 THERMAL DATA

Parameter	Description	Typ	Unit	Condition	Package
θ_{JA}	Junction to ambient thermal resistance	51.9	°C/W	Still air	88-ball UFBGA 6 × 6 × 0.6 mm
θ_{JC}	Junction to case thermal resistance	6.5	°C/W		88-ball UFBGA 6 × 6 × 0.6 mm
θ_{JA}	Junction to ambient thermal resistance	60.0	°C/W	Still air	88-ball X1FBGA 6 × 6 × 0.45 mm
θ_{JC}	Junction to case thermal resistance	7.6	°C/W		88-ball X1FBGA 6 × 6 × 0.45 mm

13.12.2 JUNCTION TEMPERATURE

The maximum junction temperature allowed on this device is 125°C.

The average junction temperature in °C (T_J) for this device can be obtained from the following:

$$T_J = T_A + (P_D \times \theta_{JA})$$

If a cooling device is required, use this equation:

$$T_J = T_A + (P_D \times (\theta_{HEATSINK} + \theta_{JC}))$$

where:

- θ_{JA}= package thermal resistance, Junction to ambient (°C/W) (see Section 13.12.1 “Thermal Data”)
- θ_{JC} = package thermal resistance, Junction to case thermal resistance (°C/W) (see Section 13.12.1 “Thermal Data”)
- $\theta_{HEATSINK}$ = cooling device thermal resistance (°C/W), provided in the cooling device datasheet
- P_D = device power consumption (W)
- T_A is the ambient temperature (°C)

13.13 ESD Information

Parameter	Value	Reference standard
Human Body Model (HBM)	±2000 V	JEDEC JS–001
Charge Device Model (CDM)	±250 V	JEDEC JS–001

13.14 Soldering Profile

Profile Feature	Green Package
Average Ramp-up Rate (217°C to Peak)	3°C/s max
Preheat Temperature 175°C ±25°C	150 – 200°C
Time Maintained Above 217°C	60 – 150 s
Time within 5°C of Actual Peak Temperature	30 s
Peak Temperature Range	260°C
Ramp down Rate	6°C/s max
Time 25°C to Peak Temperature	8 minutes max

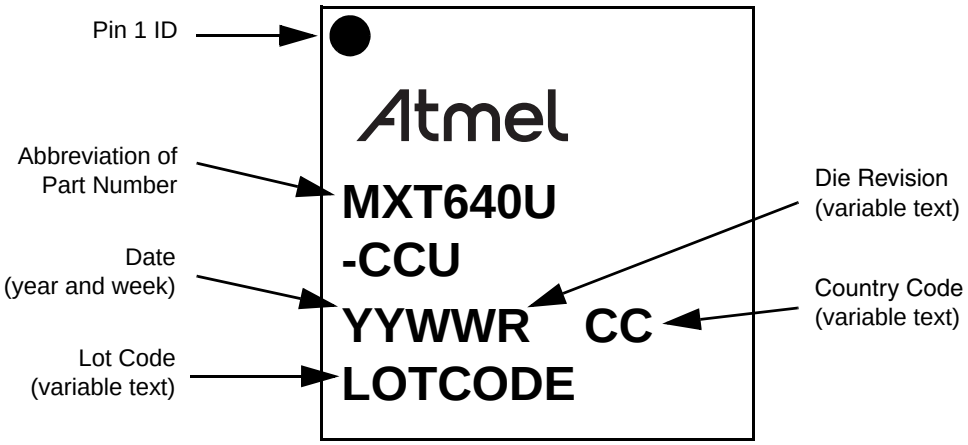
13.15 Moisture Sensitivity Level (MSL)

MSL Rating	Package Type(s)	Peak Body Temperature	Specifications
MSL3	BGA	260°C	IPC/JEDEC J-STD-020

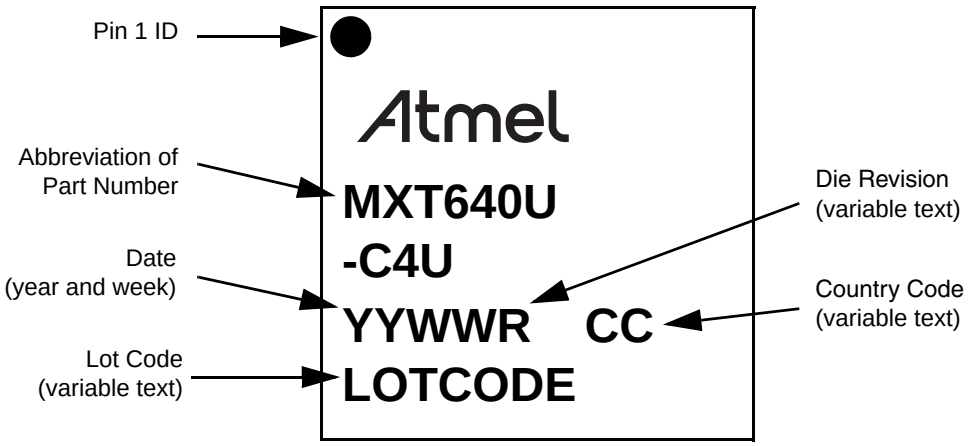
14.0 PACKAGING INFORMATION

14.1 Package Marking Information

14.1.1 88-BALL UFBGA



14.1.2 88-BALL X1FBGA



14.1.3 ORDERABLE PART NUMBERS

The product identification system for maXTouch devices is described in "Product Identification System". That section also lists example part numbers for the mXT640U device.

14.2 Package Details

The following sections give the technical details of the packages for the device.

14.2.1 88-BALL UFBGA 6 × 6 × 0.6 MM

APPENDIX B: REVISION HISTORY

Revision AX (July 2016)

Initial edition for firmware revision 1.1 – Atmel Release version

Revision A (September 2017)

Reformatted edition for firmware revision 1.1 – Microchip Release version

This revision incorporates the following updates:

- Updated to Microchip datasheet format:
  - "Pin configuration" moved to start of datasheet
  - "To Our Valued Customers" added
  - Section 14.0 "Packaging Information" updated with new headings. Part numbers moved to "Product Identification System"
  - Associated Documents moved to Appendix A "Associated Documents"
  - Revision History moved to this appendix
  - Index added
  - "Product Identification System" added
  - "The Microchip Web Site", "Customer Change Notification Service" and "Customer Support" sections added
  - Front and back covers updated
- Features:
  - Typical touchscreen size updated
  - Touch Sensor Technology section added
  - Design Services section added
  - Other feature points rearranged
- "Pin configuration":
  - Table updated to show power rail information
- Section 1.0 "Overview of mXT640U":
  - Touch detection description updated
- Section 2.0 "Schematics":
  - Schematic modified to show the maximum number of decoupling capacitors required
  - Section 2.2.1 "Power Supply": new section added
  - Section 2.2.2 "Decoupling capacitors": Advice on decoupling capacitors modified to recommend maximum number of decoupling capacitors
  - Section 2.2.3 "Pull-up Resistors": new section added
  - Note section on $\overline{\text{RESET}}$ Line removed; Creset no longer considered optional so note no longer needed
- Section 4.0 "Sensor Layout":
  - Text rearranged into sections to make layout rules clearer
  - Multiple Touch Touchscreen T100 rules updated
  - Section 4.3 "Screen Size" added
- Section 6.0 "Detailed Operation":
  - Section 6.4 "Sensor Acquisition" updated
  - Section 6.7 "Shieldless Support and Display Noise Suppression": Optimal Integration removed (included in error)
  - Section 6.14 "Adjacent Key Suppression Technology": Text rearranged to fit on page better
- Section 7.0 "Host Communications":
  - Table 7-1 and Table 7-3: note added concerning 10 kΩ resistor added
- Section 9.0 "HID-I^{2}C Communications":
  - Section 9.5 "Generic HID-I^{2}C TLC": Figures updated to show full number of packet bytes
  - Section 9.6 "Digitizer HID-I^{2}C": Figures updated to show full number of packet bytes
  - Table 9-3 updated to show the format of all bits

  - Table 9-4 updated to show the format of all bits. bytes 5, 6, 9 and 10 now shown correctly as reserved. Explanation of these bytes following the table also updated accordingly
  - Section 9.6.3 “Maximum Touches Report”: Text rearranged to aid clarity
- Section 10.0 “PCB Design Considerations”:
  - Section 10.3.4 “Voltage Pump” added
  - Section 10.4 “Voltage Regulators”: section rewritten
  - Table 10-1: Microchip LDOs added
- Section 13.0 “Specifications”:
  - Section 13.1 “Absolute Maximum Specifications”: Maximum combined GPIO pin current added
  - Section 13.2 “Recommended Operating Conditions”: Cx and Cp parameters removed (replaced by Section 13.7 “Touchscreen Sensor Characteristics”)
  - Section 13.2.1 “DC Characteristics”: Tables in sub-sections updated to show rise/fall rates correctly with explanatory notes
  - Section 13.2.2 “Power Supply Ripple and Noise” moved and now quotes single AVdd value
  - Section 13.7 “Touchscreen Sensor Characteristics” added
  - Section 13.8 “Input/Output Characteristics”: All I/O pins are listed in the table
  - Section 13.9 “I2C Specification”: Specific resistor values removed
  - Section 13.12.2 “Junction Temperature”: Maximum junction temperature added
- Appendix A “Associated Documents”:
  - Referenced documents updated
- “Orderable Part Numbers”:
  - Orderable part number updated
- DBG_DAT pin renamed to DBG_DATA
- References to restricted documents removed throughout
- References to Atmel Corporation removed or changed to Microchip Technology Inc, where appropriate
- New documentation number assigned

INDEX

PRODUCT IDENTIFICATION SYSTEM

The table below gives details on the product identification system for maXTouch devices. See "Orderable Part Numbers" below for example part numbers for the mXT640U.

To order or obtain information, for example on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	–XXX	[X]	[XX]	[X]	[XXX]
Device	Package	Temperature Range	Sample Type	Tape and Reel Option	Pattern

Device:	Base device name		
Package:	A	=	QFP (Plastic Quad Flatpack)
	CCU	=	UFBGA (Ultra Thin Fine-pitch Ball Grid Array)
	C2U	=	UFBGA (Ultra Thin Fine-pitch Ball Grid Array)
	NHU	=	UFBGA (Ultra Thin Fine-pitch Ball Grid Array)
	C4U	=	X1FBGA (Extra Thin Fine-pitch Ball Grid Array)
	MAU	=	XQFN (Super Thin Quad Flat No Lead Sawn)
	MA5U	=	XQFN (Super Thin Quad Flat No Lead Sawn)
	UU	=	WLCSP (Wafer Level Chip Scale Package)
Temperature Range:	*Blank*	=	–40°C to +85°C (Grade 3)
	T	=	–40°C to +85°C (Grade 3)
	B	=	–40°C to +105°C (Grade 2)
Sample Type:	*Blank*	=	Release Sample
	ES	=	Pre-release (Engineering) Sample
Tape and Reel Option:	*Blank*	=	Standard Packaging (Tube or Tray)
	R	=	Tape and Reel (1)
Pattern:	QTP, SQTP, Code or Special Requirements (Blank Otherwise)		

Note 1: Tape and Reel identifier only appears in the catalog part number description. This identifier is used for ordering purposes and is not printed on the device package. See "Orderable Part Numbers" below or check with your Microchip Sales Office for package availability with the Tape and Reel option.

Orderable Part Numbers

Orderable Part Number	Firmware Revision	Description
ATMXT640U-CCU023 (Supplied in trays)	1.1.AA	88-ball UFBGA 6 × 6 × 0.6 mm, RoHS compliant Industrial grade sample; not suitable for automotive characterization
ATMXT640U-CCUR023 (Supplied in tape and reel)		
ATMXT640U-C4U023 (Supplied in trays)	1.1.AA	88-ball X1FBGA 6 × 6 × 0.45 mm, RoHS compliant Industrial grade sample; not suitable for automotive characterization
ATMXT640U-C4UR023 (Supplied in tape and reel)		

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or Field Application Engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: http://microchip.com/support

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
